
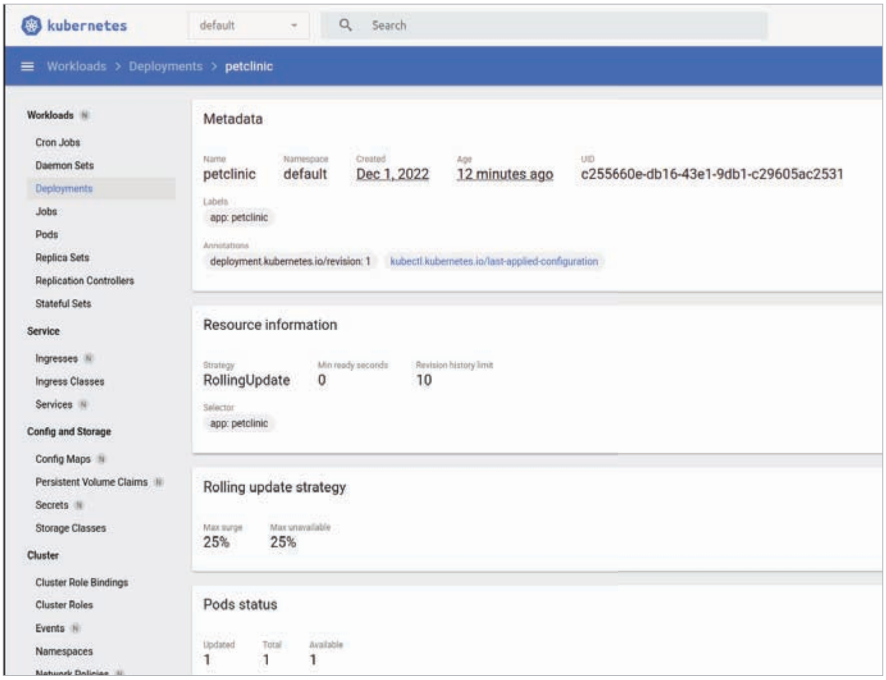

Figure 7: *PetClinic Deployment* in minikube dashboard

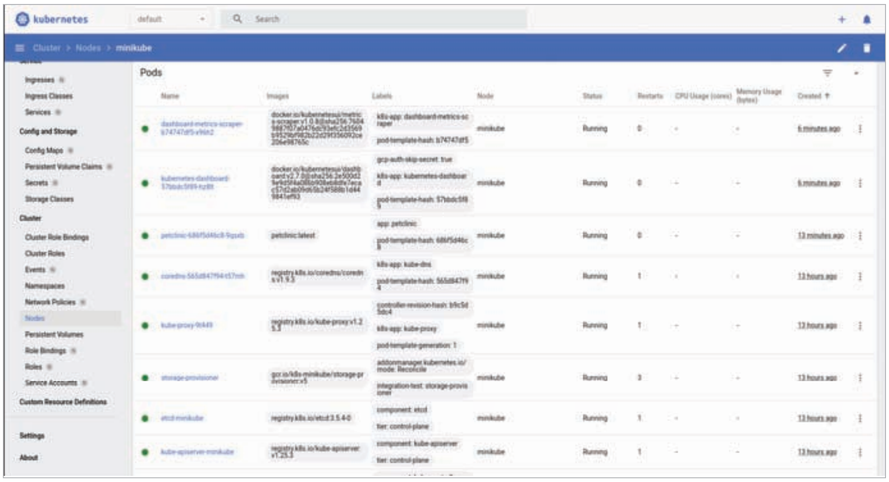

Figure 8: *PetClinic Pod* in *Nodes* section

```
petclinic    LoadBalancer   10.104.9.29
10.104.9.29   8080:30768/TCP   118s
```

Now let's verify deployments:

```
osfy@ubuntu-22-04-1-lts:~/Desktop$
kubectl get deployments

NAME        READY   UP-TO-DATE
AVAILABLE   AGE
petclinic   1/1     1            1
5m3s
```

Next, let's verify pods:

```
osfy@ubuntu-22-04-1-lts:~/Desktop$
kubectl get pods

NAME                          READY
STATUS     RESTARTS    AGE
petclinic-686f5d46c8-9qsxb    1/1
Running    0           4m56s
```

Visit the localhost:8080 in the browser and our sample application is ready (Figure 2).

Figure 3 shows the verification of the minikube dashboard.

Refer to Figure 4 for verification of workloads with respect to deployments, pods, and replica sets.

Click on *Pods* and go to the *PetClinic Pod* to verify details about it (Figure 5).

Verify the *PetClinic Service* in the *Services* section (refer Figure 6).

Verify the *PetClinic Deployment* in the *Deployments* section. Check the pod status in the same section as seen in Figure 7.

The *Nodes* section gives you details on CPU and memory consumption. It also gives you details on all the pods deployed. Check the *PetClinic Pod* in the same list.

With this, we have completed a sample application deployment in minikube successfully. Hope you enjoyed the learning in this simple 'how to' article. END
