Registering RPC

Add RPC registration in the file *NetworkoptimizerProvider.java* under *impl/src/main/java/com/cloudenablers/networkoptimizer/impl/* with the following content:

```
package com.cloudenablers.networkoptimizer.impl;
import org.OpenDaylight.controller.sal.binding.api.
BindingAwareBroker.ProviderContext;
import org.OpenDaylight.controller.sal.binding.api.
BindingAwareBroker.RpcRegistration;
import com.cloudenablers.networkoptimizer.impl.
NetworkoptimizerImpl;
import org.OpenDaylight.yang.gen.v1.urn.OpenDaylight.
params.xml.ns.yang.networkoptimizer.rev150105.
NetworkoptimizerService;
import org.OpenDaylight.controller.sal.binding.api.
BindingAwareProvider;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;

public class NetworkoptimizerProvider implements
BindingAwareProvider, AutoCloseable {
    private static final Logger LOG = LoggerFactory.getLogge
r(NetworkoptimizerProvider.class);
    private RpcRegistration<NetworkoptimizerService>
optimizerService;
    @Override
    public void onSessionInitiated(ProviderContext session)
{
        LOG.info("NetworkoptimizerProvider Session
Initiated");
        optimizerService = session.addRpcImplementation(Net
workoptimizerService.class, new NetworkoptimizerImpl());
    }
    @Override
    public void close() throws Exception {
        LOG.info("NetworkoptimizerProvider Closed");
    }
}
```

Rebuilding and starting Karaf

To rebuild and start Karaf, type the following commands:

```
mvn clean install
karaf/target/assembly/bin/karaf
```

Verifying the *networkoptimizer* module RPC

Launch the OpenDaylight API Doc Explorer with *http://127.0.0.1:8181/apidoc/explorer/index.html*, and select the *networkoptimizer* module.

> **Note:** Default credential for authentication in Apache Karaf is *admin/admin*.

```
POST /operations/networkoptimizer:service-account
Request:
{
  "input":{
  "name": "Demo_App",
  "description": "Simple ODL App"
  }
}

Response:
{
  "output": {
    "service_name": "RPC request successful for Service Name:
Demo_App"
  }
}
```
