One in six organisations in the healthcare industry report OSS breaches

One in six organisations in the healthcare industry reported breaches tied to the open source software (OSS) components used in applications, the annual DevSecOps community survey by Sonatype reported. The report also said that within healthcare organisations, the motivation to implement security controls was largely driven by compliance requirements (50 per cent), but executives were also 7.5 times more likely than developers to implement secure development practices as a competitive advantage.

In terms of automating governance and compliance to improve security, mature DevOps teams were two times more likely to properly integrate automated security tools compared to their less experienced and newer healthcare industry peers, the survey showed. The report also said that to limit susceptibility to open source software related breaches, mature DevOps respondents in the survey revealed that they were 1.5 times more likely to keep a complete Software Bill of Materials (SBOM).

The survey also reported that 67 per cent of 'happy' healthcare developers said self-paced e-learning is made available to them. As per the survey, "75 per cent of 'grumpy' developers in the industry said they don't get any training." When asked who causes the most friction on their teams, 29 per cent of happy healthcare developers said no one, while 50 per cent of grumpy developers said the executives did!

Sources at SUSE said that there was a 63 per cent increase in customer deals worth more than US$ 1 million. The company saw a 70 per cent increase in cloud revenue as it continues to expand its cloud service provider network. It is doing so by adding and growing relationships with partners including Britehouse, Exoscale, Magic Cloud, Nordicmind and Pedab, the SUSE report stated.

Melissa Di Donato, SUSE's CEO said, "Unprecedented times trigger collaboration, where communities come together to innovate for the greater good. SUSE, like many others, has been impacted by recent world events, and we are extremely grateful for the strength of our company and employees, our innovative, impact-delivering technologies, and our loyal customers, all of which have put us in the position to provide help and support to others."

Red Hat and Ingram Micro sign distribution agreement

Ingram Micro has signed a distribution agreement with Red Hat to offer Red Hat hybrid cloud technologies like Red Hat Ansible Automation Platform and Red Hat OpenShift to enterprises across the Middle East and North Africa (MENA). It will cover all Gulf and Levant countries along with Egypt, Morocco, Algeria and Tunisia. The companies said that the collaboration will make available products that enable automation, IT optimisation, digital transformation, and cloud-native development within the financial, public healthcare and telecommunications sectors.

Ali Baghdadi, senior vice president and chief executive, META (Middle East, Turkey and Africa) region, Ingram Micro, said, "Creativity, agility, and resourcefulness reinforce a competitive, entrepreneurial spirit, as does looking ahead to the future with the ambition to achieve more. Ingram Micro customers continuously strive to elevate their operations and services with a view to a long and successful future. Red Hat solutions will help them in achieving their goals and objectives, and we are delighted to be collaborating with Red Hat to help entities across an array of sectors."

Red Hat sources have said that its solutions enable channel partners and customers to build smarter hybrid cloud environments to provide portability, choice and support. Partners can also sell differently to grow their businesses, build revenue streams and create long-term relationships with a flexible subscription model. This will engage customers, based on their needs, in accessing new markets and developing upsell opportunities. The companies said that services will also be made possible by building trust and developing relationships through professional and operational service offerings.
