
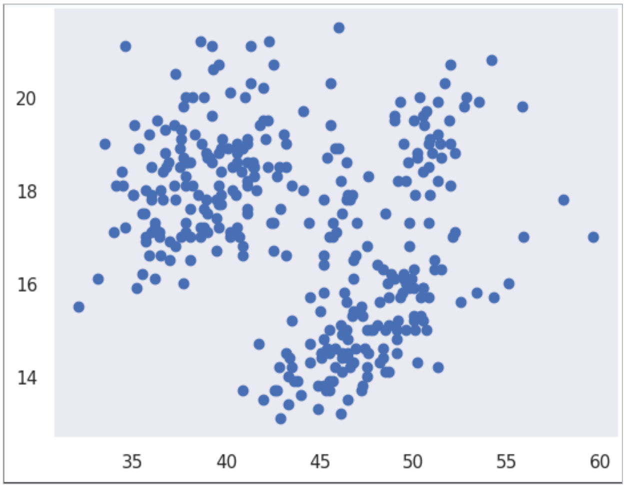

Figure 4: Scatter plot with dark background

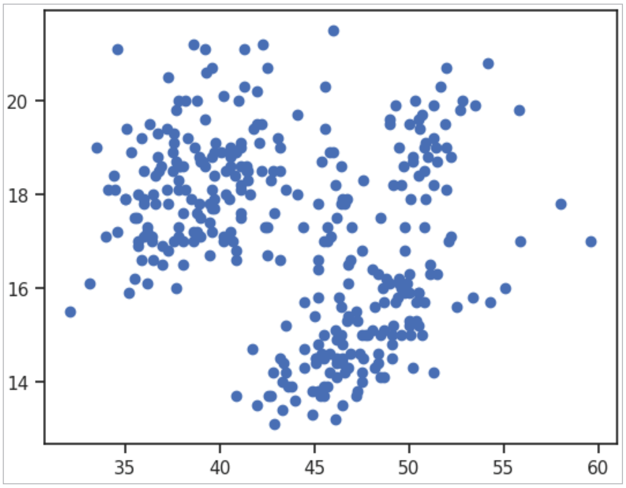

Figure 5: Scatter plot with ticks

Figure 6: Colour palettes

```
from matplotlib import pyplot as plt
import seaborn as sns
sns.set_context("notebook")
plt.scatter(df.bill_length_mm,df.bill_depth_mm)
plt.show()
```

As we discussed earlier, it is important to improve the look and the aesthetic quality of our visualisations. We can do that using the *set()* function as shown below.

```
sns.set_context("notebook")
plt.scatter(df.bill_length_mm,df.bill_depth_mm)
```

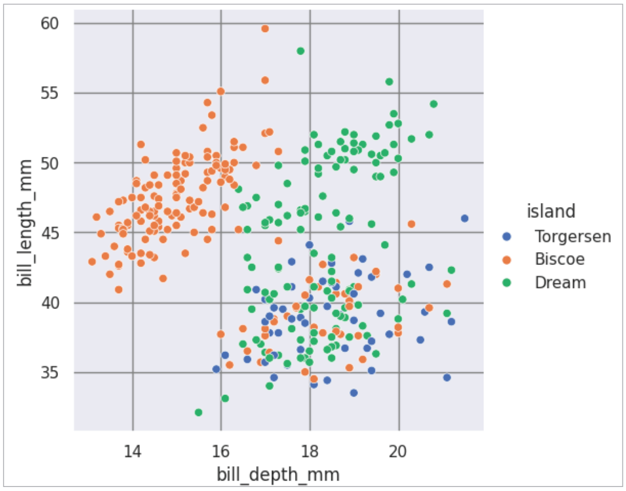

Figure 7: Multiple classes separated with colours

```
sns.set()
plt.show()
```

This will add a grey grid in the background of the graph. Let us now add a white grid in the background as shown below:

```
sns.set_context("notebook")
plt.scatter(df.bill_length_mm,df.bill_depth_mm)
sns.set_style("whitegrid")
plt.show()
```

If you want a dark background to see the graph better, use the following code (Figure 4).

```
plt.scatter(df.bill_length_mm,df.bill_depth_mm)
sns.set_context("notebook")
sns.set_style("dark")
plt.show()
```

Now if we want to add ticks in our graph to make it look better, we can use the following code (Figure 5):

```
sns.set_context("notebook")
plt.scatter(df.bill_length_mm,df.bill_depth_mm)
sns.set_style("ticks")
plt.show()
```

We can format the grid by using the code given below:

```
sns.set_context("notebook")
plt.scatter(df.bill_length_mm,df.bill_depth_mm)
sns.set_style("darkgrid", {'grid.color': 'red'})
sns.despine()
plt.show()
```
