
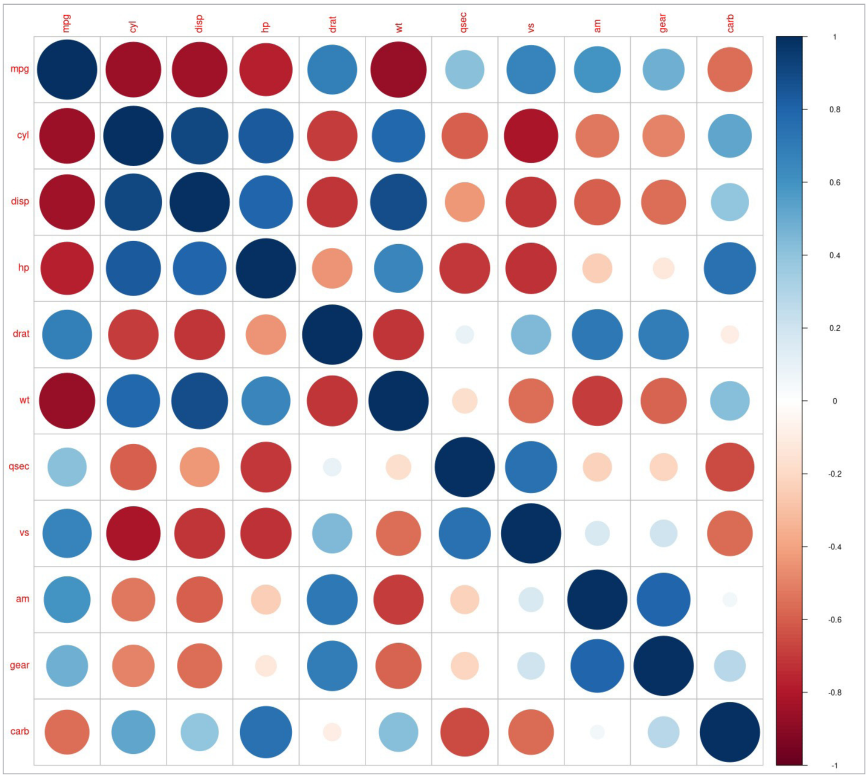

Figure 2: *Corrplot*

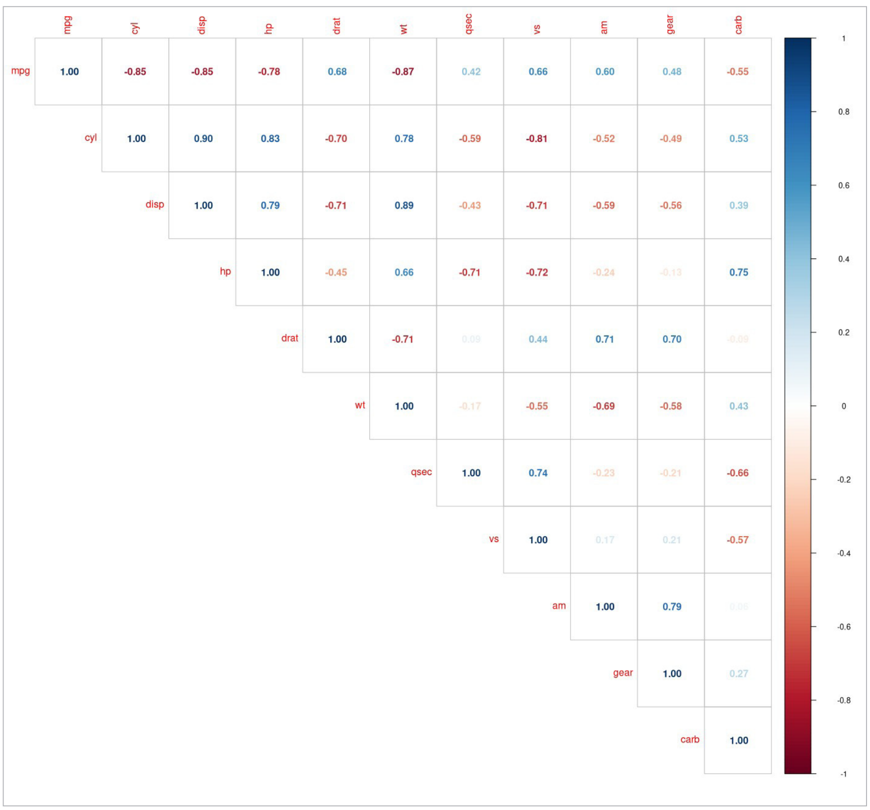

Figure 3: Corrplot (upper segment)

cylinders. The *cor.test()* function can also be used to test the association between paired samples. The correlation test between the *mtcars* cylinders and horsepower values is shown below:

```
> cor.test(mtcars$cyl, mtcars$hp)

     Pearson's product-moment
correlation

data:  mtcars$cyl and mtcars$hp
t = 8.2286, df = 30, p-value = 3.478e-09
alternative hypothesis: true correlation
is not equal to 0
95 percent confidence interval:
 0.6816016 0.9154223
sample estimates:
      cor
0.8324475
```

The *cor.test* function accepts the following arguments:

Argument	Description
x, y	numeric data vectors
alternative	'two.sided', 'greater' or 'less' alternative hypothesis
method	'pearson', 'kendall' or 'spearman'
exact	logical value to be indicated if exact p-value should be computed
conf.level	confidence level
continuity	true to use a continuity correction
data	optional data frame or matrix
subset	optional vector that specifies subset of observations to be used
na.action	function to indicate when data has NA values

We can also handle missing values in the data source vectors by specifying the 'use' argument with the *cor()* function.
