Wipro signs MoU with MTC, Oman, to set up CoE for open source

Wipro and the Ministry of Technology and Communications (MTC), Sultanate of Oman, have signed a Memorandum of Understanding (MoU) to set up a Centre of Excellence (CoE) for open source. The report said that under the MoU, Wipro and MTC will collaborate to build, deploy and sustain the CoE and speed up the adoption of open source technologies in the public and private sectors of Oman and the Gulf Cooperation Council (GCC) region.

According to a report in the Business Standard, the CoE will focus on creating a talent base of information and communication technology (ICT) graduates who will be specialists in open source capabilities. The collaboration will also provide training and skills development programmes. The report added that the CoE will encourage co-innovation by collaborating with local and regional industries in Oman and contribute to its in-country value (ICV).

Wipro will work with MTC to develop solutions and services by using open source technologies to enable digital transformation, Industry 4.0, legacy modernisation, artificial intelligence and cloud native architecture. Through this MoU, Wipro aims to expand its presence in Oman, and help MTC to achieve its goals of building a digital economy and becoming an IT powerhouse.

Dorsey also acknowledged that the process could take years. Parag Agarwal, CTO, Twitter, has been tasked to find the lead for the project. Agarwal tweeted that the ideal candidate needs to have experience working "in the open on the blockchain."

Dorsey also said that the company expects that this team will not only develop a decentralised standard for social media but also build an open community around it. This will be inclusive of companies, organisations, researchers and civil society leaders.

GitClear releases Open Repos to provide code metrics on open source projects

According to a report by *InfoWorld*, GitClear has released the free tool Open Repos to make it easier for contributors to participate in open source development. It aims to do so by making it more convenient to visualise how the code base changes between releases.

The report said that Open Repos tracks open source projects like TensorFlow, Ansible, Microsoft Visual Studio Code, Angular and React. As per the report, a blog post from GitClear stated that the aim of the product is to provide visual answers to the common practical questions people have about the status of an open source project. Such questions could be about how much change there has been between versions of open source software used in one's own code base or the velocity of code changes for the repo. Open Repos will provide interactive graphics that will show which developers have made the largest commits to each code base.

The report said the company will also provide a directory browser which will show a file-and-directory view of the repository. It will have details on the folders or files that have changed and at what rate those changes were made.

CoinField starts Sologenic Open Source Developer programme

According to a report by *GlobeNewswire*, CoinField has started a new Sologenic initiative on GitHub called the Sologenic Open Source Developer programme. The initiative aims to build an open source culture for the Sologenic community

Reza Bashash, CTO of CoinField, said, "While everybody is expecting the mass adoption of crypto to happen overnight, here at Sologenic we believe in a path. A path that is built by developers, enthusiasts, and those who are making blockchain technology move forward. A great product needs a great community and talented developers. That's why we are asking those who dream like us to join forces and build a better financial ecosystem around the blockchain while getting incentivised."

CoinField wants to create an ecosystem in which developers around the world will be encouraged to participate and create new open source projects built on top of the XRP ledger. The programme will provide developers the opportunity to work on different projects and expand their learning and leadership skills, company sources reported.
