Adobe announces Linux Version of AIR 1.5

Adobe has released Adobe AIR 1.5 for Linux. Adobe AIR 1.5, a key component of the Adobe Flash Platform, enables Web developers to use HTML, JavaScript, ActionScript and the free, open source Flex framework to deliver Web applications outside the browser.

AIR 1.5 includes functionality introduced in Flash Player 10, such as support for custom filters and effects, native 3D transformation and animation, and extensible rich text layout. Offering new features and performance improvements to create more expressive AIR applications, version 1.5 incorporates the WebKit HTML engine, and now accelerates application performance with 'SquirrelFish', the new WebKit JavaScript interpreter. Version 1.5 also includes a new, encrypted database that meets enterprise security compliance requirements while storing data more securely on customers' computers.

AIR 1.5 is available as a free download at get.adobe.com/air. The Adobe AIR 1.5 for Linux software development kit is also available for free: www.adobe.com/products/air/tools/sdk.

Hybrid: a cost-cutting open/proprietary approach

netCORE has come up with an innovative concept called 'Hybrid Messaging Environment'. This is an integration of netCORE's Linux-based Messaging Solution (EMS) with the existing MS Exchange/Lotus server.

Hybrid Messaging Solution supports a Linux-friendly messaging environment and enables full Outlook functionality. Enterprises can scale their e-mail systems and choose the most economical storage components, while the servers can communicate on a peer-to-peer basis with Exchange and the rest of the e-mail ecosystem.

New OpenSolaris unveils Time Slider visualisation tool

The OpenSolaris community has announced the release of OpenSolaris 2008.11. New features in OpenSolaris include Time Slider, an easy to use graphical interface that brings powerful ZFS functions like instant snapshots, to all users. Developers also have expanded access to repositories allowing them to get innovations out to all OpenSolaris users through the updated package manager.

In addition to performance gains, this latest version makes it easier for companies to deploy OpenSolaris solutions within their data centres. These enhancements include a new Automated Installer application, allowing users to decide which packages to include within the installation Web service; the Distro Constructor that enables users to create their own custom image for deployment across their systems; and a new storage feature called COMSTAR Storage Framework that allows developers to create an open storage server with OpenSolaris.

A few highlights of the enhanced OS are support for improved overall system performance by taking advantage of Intel Quick Path Interconnect, better scalability with Intel Hyper-Threading technology, and virtualisation with support for Intel Virtualisation Technology. Ingres rolls out Ingres Database 9.2

Ingres Corporation has announced the availability of Ingres Database 9.2, an open source database that helps organisations develop and manage business-critical applications at an affordable cost. Ingres Database 9.2, according to the company, copes with even the most complex, multi-language requirements including business intelligence, content management, data warehousing, enterprise resource planning (ERP) and logistics management.

This database is engineered to keep your Ingres-based solutions up and available around the clock, and is claimed to be the only open source database that combines the flexibility of open source with the business-critical availability and reliability of commercial database management system platforms.

Ingres Database 9.2 is said to reduce the time, complexity, and database administration (DBA) requirements by simplifying and automating many tasks traditionally associated with maintaining a business-class database. Upgrades from previous releases are a simple, highly automated task with no requirement to reload data. In addition, the release focuses on improved application development, with enhanced availability and supportability.

The database provides multi-language support with expanded Unicode features. The new features focus on increasing the availability of the server, such as enhancements to point-in-time restore and online backup. Visit esd.ingres.com/product/Ingres_Database/9.2 to download Ingres Database 9.2.
