

Director's Cut Let's Roll Out A DVD Movie

Whoever said producing DVD movies on Linux is a no-no, should think again!

I am an unabashedly proud owner of a MacBook and I was taken aback at how easy it was to create and edit a home video DVD on it. Being a downright fan of GNU/Linux, however, the first impulse I had was to replicate the experience on Fedora, a GNU/Linux flavour that I am terribly attached to and have come to swear by over the last few years.

This article is my attempt at sharing some of my findings with you. I don't know if these are the best possible techniques, but I am sure that they work. I have also tried to write this article so that one could use any

part of the home video DVD creation process without having to go through all the others. I will also try to point out alternatives and references on the Web that might contain more information on these alternatives.

A user of intermediate proficiency with GNU/Linux would very easily be able to follow the steps listed below. Novices can surely follow, but might require a little patience.

Breakdown

Here are the steps that you would roughly need to follow to get your home video DVD that can be played back on a standalone DVD player:
