

Figure 3: Menu options

to add transitions, and how to trim your clips to discard unnecessary video footage, amongst various other techniques.

With Kino, you might get a little lost when you have finished editing and want to export your final movie. To export your work, go to the **Export** tab (the lowest tab on the extreme right hand column of the *Kino* window) and go to the **DV File** tab. Right above this tab, make changes so that it reads *Every 1 frame of All*, otherwise you'll end up exporting a single clip instead of the entire movie. And keep the **Raw DV** selected.

Converting output into DVD video

DVD video has its own specific audio and video formats. Before you can create a DVD that you can view on a standalone player or on your computer software, you need to encode your finished project to this format.

For this you need to use the following commands:

```
mencoder -oac lavc -ovc lavc -of mpeg -mpegopts \
format=dvd -vf scale=720:576:harddup -srate 48000 \
-af lavcresample=48000 -lavcopts vcodec=mpeg2video:vrc_buf_size=1835 \
vrc_maxrate=9800:vbitrate=5000:keyint=15 \
aspect=4/3:acodec=ac3:abrate=192 \
-ofps 25 -o output.mpg input.format
```

If you want output for the widescreen format, you'll have to change the *aspect* to *16/9* instead of *4/3*. *input.format* refers to the output file from *Kino*. (Remember the *.dv* file that you exported?)

Figure 4: An example menu

You might also just want to make a VCD from your home movie. (Maybe it's a short movie or you are a little stingy with DVDs!) Like DVDs, VCDs also have their own specific encoding. You'll have to use the following:

```
mencoder -oac lavc -ovc lavc -of mpeg -mpegopts \
format=svcd -vf scale=352:288:harddup -srate 44100 \
-af lavcresample=44100 -lavcopts vcodec=mpeg1video \
keyint=15:vrc_buf_size=327:vrc_minrate=1152 \
vbitrate=1152:vrc_maxrate=1152:acodec=mp2 \
abrate=224:aspect=4/3 -ofps 25 -o output.mpg input.format
```

If you are a little more technically inclined, I'll urge you to study the commands for the DVD and VCD formats by yourself. It does not matter how little you understand—it'll be a start.

DVD cosmetic design

If you've done everything well till now, you should be in a position to create a DVD disc. By this I refer to the menus that you often see on DVDs with which you can navigate to see different features on the disc. You would want to have a DVD menu when you are burning more than one home video to a DVD disc, or if you have a particularly long video project (like a family marriage) and want to split it up into the various days it was spread over. Be warned however, that this splitting up would need to be done in *Kino*; that is, instead of exporting one large file depicting the entire event, you would need to export a few smaller files.

For the DVD disc creation we would be using a small but power-packed member of the FOSS world, namely DeVeDe. The following command should do the trick:

```
yum install deveDe
```

I should probably mention at this point that DVDStyler
