

with the necessary infrastructure to contribute translations. Open IRC meetings are regularly held for the Fedora Localisation Project participants. A round up of the FLP's weekly activities is also reported in the Fedora Weekly News.

Tools

The starting point for the FLP is translate.fedoraproject.org. This contains the list of all the languages and dedicated pages to reflect per-release translation completion statistics. Additionally, this page can also be used to access the *.po* files that are used for translations. Translations can be done offline using a translations editor.

Eradicating the need for cumbersome version-control operations, translated *.po* files can be directly submitted via the Transifex instance hosted on translate.fedoraproject.org, into the main back-end repositories of each package. This is especially useful for the localisation group, as Fedora allows the use of multiple version control systems according to the convenience of the package developers. Submission access to the repositories via translate.fedoraproject.org (and Transifex) is authenticated using the centralised Fedora Account System (FAS).

Currently, some projects related to Fedora (like: PackageKit and PulseAudio) have chosen to be hosted on translate.fedoraproject.org to receive translations. This set-up is maintained by volunteers from the FLP and the Fedora Infrastructure Team.

Participation

Localisation projects provide a considerably flexible platform for contributing to a free software project. Armed with the skill to read/write one's language and a fair understanding of the project/product of their choice, people can start contributing and work their way around a sizeable community group. Besides I10n, the Fedora Localisation Project provides opportunities to volunteers for various other activities like back-end

infrastructure maintenance work, Web interface designing, content enrichment and documentation, and communication. A sizeable number of volunteers from the Fedora Localisation Project are also Fedora Ambassadors in their region.

India

Similar to the global structure of the Fedora Localisation Project, the Indian languages also have a group of dedicated localisers who contribute translations for each release. A minor hiccup is the varied numbers in each individual language's contributor base. However, with the collaboration-driven model of the Fedora Localisation Project, the entry barriers are negligible. With the increase in activities of the Fedora India Ambassadors group, the localisation project is also slated for an inevitable boost in India. The localisation teams work within the Fedora community in India to promote and enhance localisation work.

Joining up

Besides fulfilling the common pre-requisites for participation (for example, FAS account and self-introduction) as mentioned in the FLP wiki page, potential contributors are expected to contact the coordinator/team for their language. The individual language groups coordinate their activities as per their internal goals and standardisation/operational procedures. The primary communication details are listed on translate.fedoraproject.org for each team. Additionally, help is always at hand on #fedora-i10n and #fedora-india IRC channels (on Freenode server) and the fedora-trans-list@redhat.com and fedora-india@redhat.com mailing lists. 

By: Runa Bhattacharjee

The author has been contributing to FOSS projects like Fedora, GNOME, KDE, etc, for over five years. She can be contacted at her e-mail address: runab@fedoraproject.org or on IRC as [mishti/runa_b](https://www.openf1s.com).
