Seclore and CDAC to bring security to OSS platforms

IIT Bombay-promoted Seclore and the Centre for Development of Advanced Computing (CDAC) have partnered to bring security to the open source platform. The partnership will focus on bringing Seclore's content level encryption (CLE) security technologies like FileSecure and InfoSource to open source platforms. According to the partners, they have taken up the mandate to ensure that advanced Information Rights Management and secure outsourcing solutions become available ubiquitously.

Speaking on the occasion, Vishal Gupta, chief executive officer, Seclore, said, "CDAC is India's foremost computing research and training institute and we are extremely proud to partner with it in this endeavour. The availability of FileSecure and InfoSource on open source technologies will bring increased security to these environments."

SUSE Linux Enterprise 9 and 10 boast of most certified software apps

Novell has announced that more than 2,500 software applications are now certified on the latest versions of SUSE Linux Enterprise, with an average of 140 new applications being added each month. Based on publicly available information, SUSE Linux Enterprise 9 and 10 have the most certified software applications when compared to the latest releases of all other commercial Linux distributions.

To complement this breadth of support, SUSE Linux Enterprise is also a preferred Linux platform for many of the most important enterprise software vendors and is the fastest growing Linux distribution, according to IDC.

HP puts GNU/Linux on one of its desktop offerings

While the days of Windows Vista may not be numbered, it's certainly challenging times for Microsoft's operating system thanks to its OEM partners, many of who are now inching towards GNU/Linux systems. HP has joined the bandwagon of such 'friendly' OEM partners, by introducing GNU/Linux as an operating system choice for business desktop customers. The offerings are designed to help small businesses enhance their productivity and ease their management of technology.

To provide customers with more cost-effective and secure computing options, HP has introduced a new desktop offering with SUSE Linux Enterprise Desktop on the HP Compaq DC5850. This joint solution delivers a tightly integrated suite of essential applications, including an office suite, Web browser, multimedia tools, and e-mail, collaboration and instant messaging software to drive productivity for business customers.

For education customers, HP is working with Novell to develop and maintain a repository of more than 40 applications, including maths, art and word games, to improve student learning. In addition, applications for school administration and instruction will be available for teachers and administrators.

HP has also announced the expansion of its virtualised browsing solution across select business desktop products. The Mozilla Firefox for HP Virtual Solution was jointly developed by Symantec and Mozilla for HP customers. The solution uses the standard release of Mozilla Firefox with a Symantec Software Virtualisation Solution layer that allows customers to use the Internet productively while keeping business PCs stable and easier to support.

Sony Ericsson now part of Open Handset Alliance

Sony Ericsson has extended its portfolio to include support for the Open Handset Alliance. Membership of the Open Handset Alliance will complement the company's existing Open OS strategy, which is based on the Symbian and Windows Mobile platforms. "Sony Ericsson is excited to announce its membership of the Open Handset Alliance and confirm its intention to develop a handset based on the Android platform," said Rikko Sakaguchi, CVP and head, creation and development, Sony Ericsson.

The Open Handset Alliance (OHA) is a business alliance of 48 firms including Google, HTC, Intel, Motorola, Qualcomm, Samsung, LG, T-Mobile, NVIDIA and Wind River Systems that came together to develop open standards for mobile devices. Besides Sony Ericsson, 13 new companies have joined the Open Handset Alliance. The new members are: AKM Semiconductor Inc, ARM, ASUSTek Computer Inc, Atheros Communications, Borqs, Ericsson, Garmin International Inc, Huawei Technologies, Omron Software Co Ltd, Softbank Mobile Corporation, Teleca AB, Toshiba Corporation and Vodafone.

New members will either deploy compatible Android devices, contribute significant code to the Android Open Source Project, or support the ecosystem through products and services that will accelerate the availability of Android-based devices.
