

Figure 4: In Eclipse, right click the Android project and select 'Run as an Android Application'

Figure 5: Emulator starts

We will need the following pre-installed on a PC for the exercise:

1. JDK 1.5
2. Eclipse 3.3/3.4 with JDT and WST plug-ins
3. The Android SDK
4. Android development tools (optional)

We are carrying out the exercise on a Ubuntu 8.10 using Sun Java 1.6 and Eclipse 3.4 (Ganymede). And we used `apt-ed sun-java6-bin` for a Java installation. You can alternatively download JDK 1.6 for Linux from <http://java.sun.com/javase/downloads>.

We downloaded Eclipse 3.4.1 (Ganymede) for Linux 32-bit from www.eclipse.org/downloads. We also downloaded Android SDK from code.google.com/android/download.html. Installation

Figure 6: The project hierarchy

instructions can be found at code.google.com/android/intro/installing.html.

Once Android SDK and Eclipse are installed (you can follow the document help.ubuntu.com/community/EclipseIDE) on Ubuntu, we started Eclipse and installed the ADT on the Android Development Toolkit. We installed it as an Eclipse plug-in from *Help-->Software Updates-->Available Software-->Add-->Site--><https://dl-ssl.google.com/android/eclipse/>-->Install*.

Once done, you need to restart Eclipse.

Simulator and the Android Eclipse plug-in

Once everything is ready, we can do some development on the Android platform. Before that we need to run the Android simulator. Figures 2, 3, 4 and 5 are some screenshots to help you get started with the Android simulator from within
