

DVD OF THE MONTH

This month, we bring the latest Linux distros to you.

MX Linux 19.1 Live (64-bit)

MX Linux is a cooperative venture between the antiX and former MEPIS communities, and has the best tools from each distro. It is a mid-weight OS designed to combine an elegant and efficient desktop with simple configuration, high stability, solid performance and a medium-sized footprint. MX-19.1 is a refresh of the MX-19 release, consisting of bug fixes and application updates since the original release of MX-19. If you are already running MX-19, there is no need to reinstall this version. Packages are all available through the regular update channel. The DVD is live-bootable with 64-bit computers.

Manjaro Linux 19.0

Manjaro is a professionally built Linux based operating system that is a suitable replacement for Windows or MacOS. Multiple desktop environments are available through its official and community editions. The developers also work with manufacturers to design dedicated hardware. It's a free OS for everyone and is an excellent entry point into the Linux world. Unlike proprietary operating systems, users have full control over their hardware, without restrictions. This makes it ideal for people who want to learn how Linux works and how it is different from other operating systems. You can find the ISO image of the distribution in the *other_isos* folder on the bundled DVD.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system.

Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, refer to the hardware documentation for your computer/laptop.
