

detected with OWASP Nettacker include those found via brute-force attacks, ProFTPD (FTP server) vulnerabilities, expired certificate issues, weak signature algorithms, cross-site scripting, header misconfigurations, server version-specific vulnerabilities, clickjacking, heartbleed attacks, CCS injection, and pma (PhpMyAdmin) attacks.

The brute-force scan option assesses the security of different network protocols like FTP, SSH, telnet, HTTP, NTLM, and xmlrpc protocols. The ProFTPD-related scanning covers vulnerabilities like bypass SQL protection, CPU consumption, directory traversal, heap overflow, integer overflow, restriction bypass, and memory leak vulnerability detection.

OWASP Nettacker is a Python based project that is tested on different operating systems including Linux, MacOS and Windows OS. The framework is compatible with both Python versions (2 and 3). OWASP Nettacker depends on the different packages in the *requirements.txt* file that are included in the framework's source code directory.

Features:

- IoT scanner, network service analysis and services brute-force testing
- Services vulnerability testing, information gathering, fuzzing, HTTP/HTTPS crawling with HTML/text outputs
- Python multi-thread and multi-process network information gathering vulnerability scanner
- Service and device detection (SCADA, restricted areas, routers, HTTP servers, logins and authentications, none-indexed HTTP, paradox system, cameras, firewalls, UTM, WebMails, VPN, RDP, SSH, FTP, TELNET services, proxy servers and many devices like Juniper, Cisco, switches and much more...)

Latest version: 0.0.1

Jok3r

Jok3r is a Python3 CLI application based automated testing framework for network infrastructure and Web black security tests. It quickly identifies the 'low-hanging fruit' type of vulnerabilities on most common TCP/UDP services and other Web technologies, and combines open source tools in a smart way.

Features:

- Over 50 open source tools and all applications packed in a Docker image running Kali OS on a Docker hub.
- Tools updatable on a single command and easy interface for addition/removal of tools.
- Targets most common TCP/UDP services (HTTP, FTP, SSH, SMB, Oracle, MS-SQL, MySQL, PostgreSQL, VNC, etc).
- Supports automatic fingerprinting (product detection) of targeted services.
- Automatically scans and/or exploits most critical vulnerabilities (e.g., RCE) on Web and application servers (e.g., JBoss, Tomcat, Weblogic, Websphere, Jenkins, etc).
- All outputs from security checks, detected credentials and vulnerabilities are stored into the database and can be accessed easily.
- Automatically runs vulnerability scanners on most common CMS (WordPress, Drupal, Joomla, etc).

Latest version: 3.0

Legion

Legion, a fork of SECFORCE's Sparta, is an open source, easy-to-use, super-extensible and semi-automated network penetration testing framework that aids in the discovery, reconnaissance and exploitation of information systems,

and is powered by 100+ auto-scheduled scripts.

Legion provides an easy-to-use graphical interface, unlike most tools mentioned here. It's a modular framework, allowing you to add or customise functionalities. It's another pen testing tool that's written in Python, which means that it can also run on any system capable of running Python, i.e., it supports Windows, MacOS and Linux.

Features:

- Automatic recon and scanning with NMAP, whataweb, nikto, Vulners, Hydra, SMBenum, dirbuster, sslyzer, webslayer and more (with almost 100 auto-scheduled scripts).
- Easy-to-use graphical interface with rich context menus and panels that allow pen testers to quickly find and exploit attack vectors on hosts.
- Modular functionality allows users to easily customise Legion and automatically call their own scripts/tools.
- Highly customisable stage scanning for ninja-like IPS evasion.
- Automatic detection of CPEs (Common Platform Enumeration) and CVEs (Common Vulnerabilities and Exposures).
- Real-time autosaving of project results and tasks.

Latest version: 0.3.6b
