

Alexander Jeffries, CEO at Stordis, said, "Being a member of the TIP is important for us because it enables us to contribute to the transition of the IT industry. The concept of open source becomes more and more relevant across all fields of the network industry, including telecommunications, academia and research, broadcasting, and cyber security. Connecting with interested parties who actively contribute to this progress is essential for advancement and innovation. With this in mind, we have designed the Stordis Advanced

Programmable Switches (APS), which are the only P4 programmable switches that support 1588v2."

Stordis makes network equipment including bare metal switches and adapter cards. It has also built programmable switches based on the

Tofino ASIC processor from Barefoot. TIP members include project groups, startups and other collective initiatives. It provides physical space for research and development. It has more than 500 participating member organisations, including operators, suppliers, developers and integrators. Recently, it announced a collaboration with the Open Networking Foundation (ONF) to accelerate the rollout of open networks.

Attilio Zani, executive director, Telecom Infra Project said, "We are very pleased to welcome Stordis to our community, which is expanding the scope and value of disaggregation to the industry. We look forward to a promising collaboration on device programmability to make telecom networks far more open and efficient."

Huobi starts beta testing of its open source DeFi blockchain

According to *Cointrust*, cryptocurrency exchange Huobi has disclosed the public testnet rollout of its open source decentralised finance (DeFi) blockchain, Huobi Chain. It aims to offer an infrastructure that complies with regulatory guidelines for financial service providers to install apps in finance-associated industries.

The report added that Huobi Chain uses a variable governance model that complies with the requirements of different regulators and enterprises. Based on

an assigned proof-of-stake consensus, it allows regulators to offer their inputs to the network through distinct regulatory nodes. Compliance with KYC (Know Your Customer) norms and anti-money laundering

(AML) laws is done parallelly with a decentralised identifier tool. This tool will offer confirmable digital identities on the network.

The chain backs crypto currencies such as Ether (ETH) and Bitcoin (BTC), as well as assets issued by Huobi. It includes Huobi Token (HT), which will function as the only utility token on the network.
