

Volterra raises US\$ 50 million in funding for its distributed cloud platform

Volterra has emerged from two years of stealth operations with over US\$ 50 million in funding to date. Investors include venture capital firms Khosla Ventures, Mayfield and M12 (Microsoft's venture fund), as well as a growing set of strategic investors and partners including Itochu Technology Ventures and Samsung NEXT.

"They clearly see the challenge that enterprises are facing as they distribute applications across clouds and the edge, and have assembled a team of more than a 100 experts to build the solution. With our work for over 30 customers already in production, we are confident that Volterra will make a major impact on the distributed cloud market," said Navin Chaddha, MD, Mayfield.

Ankur Singla, the company's CEO and founder, told Fierce Telecom that the funding would be used for its go-to-market efforts, which include direct, channel and service provider sales, in the US, Asia Pacific (with a major focus on Japan), and Europe, as well as for global marketing. He doesn't anticipate needing another funding round until late 2020 or sometime in 2021.

Singla added that the firm is only two years old, and has built VoltMesh, VoltStack and Volterra Console from the ground up using microservices while enabling cloud operational principles for its customers. In addition, all its software is 100 per cent microservices, and was created from scratch as a multi-tenant SaaS offering.

by India, Germany, the UK, Japan, Canada, France, Russia, Brazil and Hong Kong. Australia was the 12th largest region outside of the US measured by clones and forks of open source software on the site. After Australia came South Korea, Spain, Ukraine, Poland, Singapore, Indonesia, Taiwan and Vietnam.

As per the report, Hong Kong was the fastest-growing region globally by percentage growth of contributors (101 per cent), followed by Singapore (77 per cent), Japan (60 per cent), South Korea (46 per cent) and the Netherlands (37 per cent). Meanwhile, over 350,000 people made a combined 5 million-plus contributions to the top 1000 open source projects this year.

Deezer releases open source AI tool that quickly isolates vocal tracks

Spleeter, the AI tool released by Deezer, can split a track into four stems (stemming means to isolate vocal tracks from a mixed-down audio file) 100 times faster than real-time, claims the company.

French streaming platform Deezer has launched an AI tool named Spleeter that can isolate vocal and instrumental tracks quickly and separate a song into two, four or five separate audio tracks. It has released the software as an open source package on GitHub though it was originally developed for research purposes.

At present, the software lacks a graphical user interface. As it is open source, a streamlined user interface can be developed. Though there are many techniques to isolate vocal tracks from a mixed-down audio file (called 'stems'), most of them are difficult, time consuming and of low quality.

Spleeter is an audio separation library built on Python and the machine learning platform, TensorFlow. It can split a track at many times the speed of the original audio, says the company. Spleeter works on 'source separation' by using machine learning to separate tracks into their composite stems like bass, drums, vocals, guitar and piano.

SpaceChain to build open source blockchain based satellite network

According to a report by Geospatialworld, Singapore based startup, SpaceChain, aims to build an open source blockchain based satellite network. The company plans to establish itself as the integrator of space and blockchain technology, a

move that will help organisations protect their digital assets against cyber criminals and hackers, says the report.

The company also wants to create infrastructure for the blockchain industry that will allow for the collaboration between space and blockchain

sectors in the future. The report says the company wants to educate space professionals and the blockchain industry as well as create a global ecosystem that will connect businesses, developers and consumers in a way that is geared for innovation.

SpaceChain's blockchain partners include companies like Bloq, Biteu and Qtum, and its space domain partners are Alba Orbital, Deimos, SpacePharma, Nanoracks, Kubos and Open Cosmos.
