

DVD OF THE MONTH

Linux for your network and storage.

Fedora 31 Workstation Live

Fedora Workstation focuses on the desktop, and caters to the needs of software developers who want a 'just works' Linux operating system experience. This release features GNOME 3.34, which comes with significant performance enhancements that are especially noticeable on lower-powered hardware. It is a polished, easy-to-use operating system for laptops and desktop computers, with a complete set of tools for developers and makers of all kinds.

Zentyal Server 6.1

Zentyal Linux Server was launched in 2004. It incorporates all the network services required in corporate environments, most importantly the first-ever native Microsoft Active Directory implementation on Linux that is easy to use. With Zentyal Server, there is no need to use the command line – systems administrators can manage all the network services via the graphical user interface.

XigmaNAS 12.1.0.4

The XigmaNAS operating system can be installed on virtually any hardware platform to share computer data storage over a computer network. NAS, here, refers to network attached storage. XigmaNAS is the simplest and fastest way to create a centralised server for all kinds of data that's easily accessed with various network protocols. XigmaNAS can be installed on compact Flash/USB/SSD keys, on hard disks, or booted from a live CD/liveUSB with a small USB key for configuration storage. Details about installation and logging in can be found at <https://sourceforge.net/projects/xigmanas/files/XigmaNAS-12.1.0.4/12.1.0.4.7091/>.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
