

Cloud Foundry Certified Developer Exam course now open sourced

The Cloud Foundry Foundation, which is the home to the open source Cloud Foundry Platform-as-a-Service (PaaS), has announced that it will open source its educational material. It says this move has been taken to prepare developers for its Cloud Foundry Certified Developer Exam. The 2019 Dice.com jobs report rated PaaS skills in its top 10 paying tech skills.

The company says the material will include content for both instructor-led discussions and

hands-on examples, in addition to the existing Cloud Foundry developer training

course. In order to check that the prep course does not duplicate the elements of the exam too closely, the company will take a functional look at the Cloud Foundry competencies, which may be covered in the exam.

Chip Childers, CTO, Cloud Foundry Foundation, said, "By making this material available widely, we give the most people possible the ability to prepare for the Cloud Foundry Certified Developer Exam."

The exam takes about three hours to complete, and consists of performance-based questions and multiple-choice answers to test developers on their practical and conceptual knowledge of Cloud Foundry and general cloud-native architecture principles

Recently, at the Open Source Summit Europe in France, Megan Byrd-Sanicki, a Google open source strategist, had announced that the company is working on a new programme that will bring technical writers to open source projects that do not have sufficient resources to do documentation correctly.

End user spending on public cloud services to grow at 25 per cent in 2020: Gartner

According to a recent report by Gartner, end user spending on public cloud services

in India is forecast to total US\$ 3.4 billion in 2020, a 25 per cent increase from 2019. This double-digit growth will position India as the No. 3 country for end user spending on public cloud services, behind China and Indonesia.

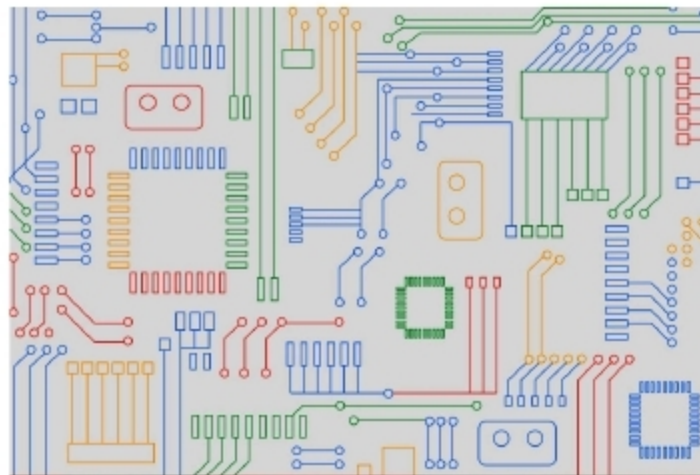

"Moving to the cloud and investing in public cloud services have

become imperative to the success of digital business initiatives. It's no longer a question of 'why', but a matter of 'when' organisations can shift to the cloud," said Sid Nag, research VP at Gartner.

Nag added, "We have entered the Cloud 2.0 era, during which organisations are adopting a cloud-first or a cloud-only strategy."

Google launches open source secure chip design project, OpenTitan

At a time when tech giants and governments are becoming aware that enemy nations are trying to carry out surveillance or espionage, Google has partnered with

several tech companies to build and develop a collaborative open source secure chip design project called OpenTitan. Sources at Google have said that OpenTitan will be run by LowRisc, which is a non-profit organisation. It will also be supported by ETH Zurich, G+D Mobile Security, Nuvoton Technology and Western Digital.

The collaboration aims to build trustworthy chip designs that are both open and transparent for use in data centres, storage and computer peripherals. Making these open source will allow anyone to inspect the hardware for security vulnerabilities and backdoors, claims Google.

The Open Compute Project, supported by Facebook, Intel and Google, was also created to open source designs for core infrastructure servers to provide better efficiencies from data centre operations.

Robocorp receives US\$ 5.6 million to bring open source to RPA

San Francisco based startup Robocorp, which aims to bring open source and Robotic Process Automation (RPA) together, has received a US\$ 5.6 million seed investment.

The investment round was led by Benchmark and saw participation from Slow Ventures, Firstminute Capital, Bret Taylor (president and chief product officer at Salesforce) and Docker CEO Rob Bearden. The company aims to use the money to add new employees and scale the cloud product, while simultaneously working to build the open source community.
