

RPA helps in automating long manual workflows inside big organisations. Robocorp co-founder and CEO Antti Karjalainen said that the company is introducing open source and cloud native technology into the market and focusing on developer-led technologies. He added that the company aims to provide developer tools in an open source model, where the tools are free to use.

Waves launches new open source wallet called WavesFX

Open blockchain platform Waves has launched its new wallet WavesFX, according to a report by CryptoNinjas.

This will be an open source solution for various operating systems like Windows, MacOS and Linux. The report by CryptoNinjas quotes from a statement by Waves announcing the launch of the first version of the wallet that was released in October this year. The statement said that if the wallet becomes popular, the company will consider including it in one of the upcoming grant batches, which will enable developers to add more functionality to the wallet. Currently, this wallet platform is not part of the Waves Labs grant programme.

WavesFX comes with multi-network functionality, multi-address accounts, moving assets, transfer or mass transfer of assets, etc, company sources report. It also has features like leasing, token creation, setting account scrips, and the creation of aliases. The multi-network functionality will let users operate and switch between networks and moving assets, a feature that enables users to move addresses at once, say sources at Waves.

MongoDB enters into partnership with Alibaba Cloud

General purpose database platform MongoDB Inc. has entered into a partnership with Alibaba Cloud to give customers an authorised MongoDB-as-a-Service solution. Alibaba will provide end-to-end management and support for customers

on current and future versions of MongoDB, with the ability to escalate bug fixes and support issues on the latter's behalf.

Dev Ittycheria, president and CEO of MongoDB, said, "Not only is China one of the largest markets for database software, but there also has been enormous adoption of MongoDB in this

market. In fact, over the past four years, the most downloads of MongoDB have been from China, reflecting the global popularity of MongoDB's next-generation database platform. Now, customers of all sizes have access to the only authorised MongoDB DBaaS offering in mainland China. We're excited to partner with Alibaba Cloud to enable customers to use MongoDB to transform their businesses."

Alibaba will be supporting new MongoDB features like multi-document ACID (atomicity, consistency, isolation, durability) transactions, aggregation pipeline type conversions, non-blocking secondary reads, extensions to change streams, etc. The company will also provide 40 per cent faster data migrations, say sources at Alibaba.

Feifei Li, VP of the Alibaba Group, as well as the president and senior fellow of the database system, Alibaba Cloud Intelligence, said, "Combined with Alibaba Cloud's native data analytics capabilities, working with partners like MongoDB will empower our customers to generate more business insights from their daily operations."

ProtonMail makes its iOS app open source

CERN-headquartered ProtonMail has announced that its iOS app has gone open source. The email service company's Web application has been open source since 2015. Earlier this year, the company had an audit of ProtonMail's iOS application (conducted by security firm SEC Consult), and has now made the app open source after it's been independently approved.

Apart from the SEC Consult audit, ProtonMail has also undergone third-party audits for its open source cryptographic libraries, OpenPGPs and GopenPGP. The company has documented and published its iOS security model. This will help because raw code without documentation can be almost unintelligible sometimes. Hence, a documented security model will help in the rigorous assessment and review of the code by the public. ProtonMail has made the iOS trust model available on its GitHub page.

The company says that making the application open source will let people review the code, which in turn will increase trust in the security of the platform. This will also lead to the development of a more private Internet. The company says that by making the code freely accessible to the developer community, it will lead to innovation in the field of privacy tech. Developers will be able to implement and build methods from these codes that could be documented and published. It can also result in safer and more robust iOS apps, the company believes.

ProtonMail sources say that in recent times there has been an increase in state-sponsored malware attacking iOS, including attacks on ProtonMail users. This security model will give users a higher level of security compared to typical apps, claim ProtonMail spokespersons.
