

institutions are a bit more cautious in doing so.

Q. Are there any specific countries or geographic regions that are leading this trend?

A. We see the growth as pervasive across geographies. India, for example, has some amazing stories of open source adoption in government, in initiatives like Aadhaar.

Q. Are you seeing an increase in the number of deals that require systems integrators (SIs) like Infosys to have expertise on various open source stacks?

A. As clients look to reduce their dependence on proprietary software, manage costs, and introduce increased agility and innovation, most application modernization deals today have open source as an integral component. We see this trend only getting stronger, so building open source competencies at scale is a must for every global SI.

Q. In the earlier days, there were a lot of myths about open source. Some proprietary brands were deliberately spreading FUD (fear, uncertainty and doubt) too. Today, what are the common myths or other inhibiting factors that prevent firms from adopting open source?

A. While the awareness and acceptability of open source has certainly increased a lot over the years, we still notice the prevalence of some myths. Most of them are related to open source support, security, enterprise scalability and reliability.

Clients also face challenges in adopting open source at the enterprise scale – including identifying the

best-fit solutions from a plethora of technologies, navigating a complex vendor ecosystem and making their open source journeys cost-neutral. In all our client conversations, we focus on debunking any myths and helping our clients make informed and optimal decisions in their open source journeys.

Q. How is Infosys gearing up to become a leading SI in the open source space? What new initiatives has the company taken in the last few years?

A. Open source is a strong focus area for Infosys. We have established an open source practice that works with all our services lines to execute client engagements, drive internal innovation, open source contribution and talent enablement. We have a comprehensive set of service offerings – spanning open source advisory services, architecture consulting, implementation, migration and support – to help our clients accelerate open source adoption.

Our architects bring both depth and breadth across the stack to deliver end-to-end solutions. We have built a suite of in-house tools and accelerators to further speed up open source based modernization and migration initiatives.

We have a strong ecosystem of more than 25 partners, which helps us offer end-to-end services and a single commercial interface to our clients by bundling product subscription and support along with our application services.

We have a razor-sharp focus on talent enablement at scale – we have over 330 open source courses, which our employees can access via our ‘learn anywhere’ platforms, and to date, over 65,000 people have been trained on open source.

Q. Are there any major open source case studies that you'd like to share with our audience, particularly a case study from India?

A. There are several exciting case studies, none more impressive than from our own backyard – the GSTN project and the platform behind the most extensive indirect tax reforms in Indian history. This is also one of the largest and most complex in the world.

Infosys had the privilege of designing and building this ‘population-scale’ platform using an entirely open source stack, based on fundamental principles like openness, no vendor lock-in, security, reliability, availability and scalability. The system is capable of handling some astonishing volumes – around 50,000 invoices per second and 1.2 billion invoices on the last day of filing, with extremely high availability and performance. The system has been tested to handle up to 135,000 concurrent user filings and 2,000,000 tax returns on a single day. It also collects US\$ 3.7 billion of tax revenues on the peak day across 800,000 transactions.

Case studies like GSTN showcase the power of open source in every aspect and should convince any sceptics about its suitability at the enterprise scale.

Q. How does your team empower or enable other teams at Infosys, when it comes to open source?

A. Enablement of architects and developers across the company is one of the key responsibilities of our open source practice. There are three pillars of enablement – internal learning systems, partners and hackathons. We have dedicated open source technology trainers within the education, training and assessment team to enable employees at scale. Our partner and
