

Q . Overall, how important is India to JFrog globally – as a development and tech-support centre, as well as a market?

A. JFrog opened its first office in India more than three years ago. It was a development office with people working on JFrog Insight and JFrog Mission Control (which provide pipeline tooling and performance visibility). We purchased an organisation called Shippable at the beginning of this year for its technology and R&D team, who then created the JFrog Pipelines product. Shippable is also located in India, so this country has been and is increasingly important from both an R&D and support perspective. A lot of our senior support force is in India,

so we need really good developers working at JFrog to handle the high-tech support volume. We are already at 60 employees in Bengaluru and have recently appointed a general manager. As you know, JFrog is now a company of more than 500 people. We are also growing our marketing and sales teams in India, which will help drive the DevOps revolution for Indian customers.

Q . Are these customers more of global accounts that have shops in India or are these Indian companies?

A. Both. We started with the global companies with R&D in India. Today, we have companies throughout India that are directly buying from us.

Q . A little bit about your personal journey – when and how did you connect with the open source world?

A. I will date myself and say that in 1992, I used to play with Mosaic while I was in university, and I created a Web server based on open source Web stacks. Gloriously geeky stuff, but it put me in the OSS community right from the beginning. When I was a kid, I used to share code and OSS was the way I learned how to code in the first place. It's clear to me that OSS is the future for creating innovative software, and I – and JFrog – continue to support and contribute to development communities globally. I look forward to seeing OSS and OSS communities drive the innovations of the future. **END** 🐧
