order to resolve all types of operational challenges. They need to have the capabilities to develop digital pipelines. These engineers collaborate with developers and IT teams to plan code releases. Most of them are developers who have an interest in operations and deployment, or are admins who have a deep knowledge of coding and the SDLC (software development life cycle) and move towards the development side. Their major role is to improve and speed up the testing and deployment process.

A DevOps engineer needs to be an excellent communicator. The role is very similar to that of an IT project manager. In a team, these engineers work with other professional experts and manage different pieces of the infrastructure puzzle. Project managers and DevOps engineers could be considered as two sides of the same coin, each with a slightly different perspective. DevOps engineers are also considered mentors of software developers and architecture teams inside an organisation, guiding them in

the creation of software. Their job also requires collaboration between the IT and security teams, to ensure the release of quality products.

Required experience

It is an accepted fact that there is no such thing as a 'junior' DevOps engineer. (This is a very popular topic on Reddit and StackOverflow.) This implies that to become a DevOps engineer, you need to have many years of experience and an in-depth understanding of related tools. You must have experience in integration technology, automation and cloud coding languages. The career path for learning all this is through project management, systems management and database administration. After gaining about two to three years of experience in these domains, a person could be eligible to serve as a DevOps engineer.

These engineers are specialists in writing scripts to make changes in existing cloud setups instead of creating new ones. That is why organisations that hire DevOps engineers are able to deploy code within less time and with more accuracy than their competitors. This implies that whoever wishes to choose this career path must have excellent skills in open source technologies, and a vast knowledge of the tools and technologies used by their senior engineers.

Required skills

Some major skills required for a DevOps engineer's job include:

- Agile project management
- Cloud technology
- Container concepts
- Continuous integration
- Deployment automation and orchestration
- Infrastructure automation
- Open source OSs
- Orchestration
- Source control

Along with expertise in all the above areas, it is mandatory to have
