

a four-year degree in IT. Apart from the technical aspects, the following are some generic skills essential for DevOps engineers:

- Coding or scripting
- Process re-engineering
- Communication and collaboration skills

Basically, a DevOps engineer is someone who will take on the hard work and responsibility of developing and deploying a software project, and earn the profits from consumers. This role could be played by a single person or a team, but the major focus is to get the work done.

Salaries of DevOps engineers

DevOps engineers are currently paid very well around the world, though the amount could vary depending upon different factors like the size of the company, years of experience, skills, the country they work in, etc. But they are counted among the highly paid staff in an organisation.

The future of DevOps

What every engineer needs to understand is that software technology is progressing every day, and coding and scripting skills are also changing with time. Technology is growing very rapidly, and DevOps engineers need to adapt to new trends to retain their place in the market.

Hiring DevOps professionals has had a positive impact on IT organisations in terms of team management, meeting deadlines and development frequency. Companies that responded early by converting to the DevOps method have benefited.

This new career path has a huge impact on a company's culture, as well. It has become more than an IT function. For many organisations, it is becoming a philosophy, and instead of hiring a single person, these companies are building DevOps teams.

Many organisations may prefer using their own senior resources for

Figure 3: The DevOps process

this role instead of hiring new staff. As mentioned above, the experience is the main requirement for this job and hiring external resources could be risky. Also, external resources take time to settle into the organisation's culture and understand its working style. That is the reason why companies promote their own experienced staff as DevOps engineers.

Who is the right person for this job?

The right person for this job would be someone who has very well-polished deployment, automation and infrastructure automation skills. These skills are not learned in college but while working in the field, performing diverse IT roles and, in time, acquiring a balanced knowledge of software development and project management. Along with all the technical knowledge, skills and expertise, a DevOps engineer should have the following soft skills:

- Excellent management skills
- Be a team player and team manager
- Good communication skills
- Problem-solving skills
- Critical thinking
- Be adaptable to changes
- Have a passion for learning the latest in technology

DevOps jobs are considered to be high paying and long term. While moving towards this career path, a person should know that more than a role, it is a culture that needs to be nurtured within the development team of a software company. This department is more about increasing

the deployment of microservices.

The future of DevOps also relies on providing serverless computing and determining which use case is appropriate for a certain diverse environment. By acquiring these skills, DevOps teams can lead their companies when decision-making strategies have to be made.

The DevOps engineers' primary focus is on customer satisfaction. They are committed to delivering quality products to their customers. They need to have a broad vision and a clear understanding of the client's requirements, as well as of the technologies and resources required for a particular project. As there is no training or course that people can take prior to becoming DevOps engineers (most of them have a software development background), they often lack some basic management and planning skills. There is a huge difference between a developer and a DevOps engineer. The former's only job is to code and create software while DevOps engineers should have the ability to see the bigger picture, which is essential to satisfy the customer. For this purpose, whenever developers decide to switch to DevOps, they should learn a few project management skills, as both these roles are very similar. **END** 🐧
