

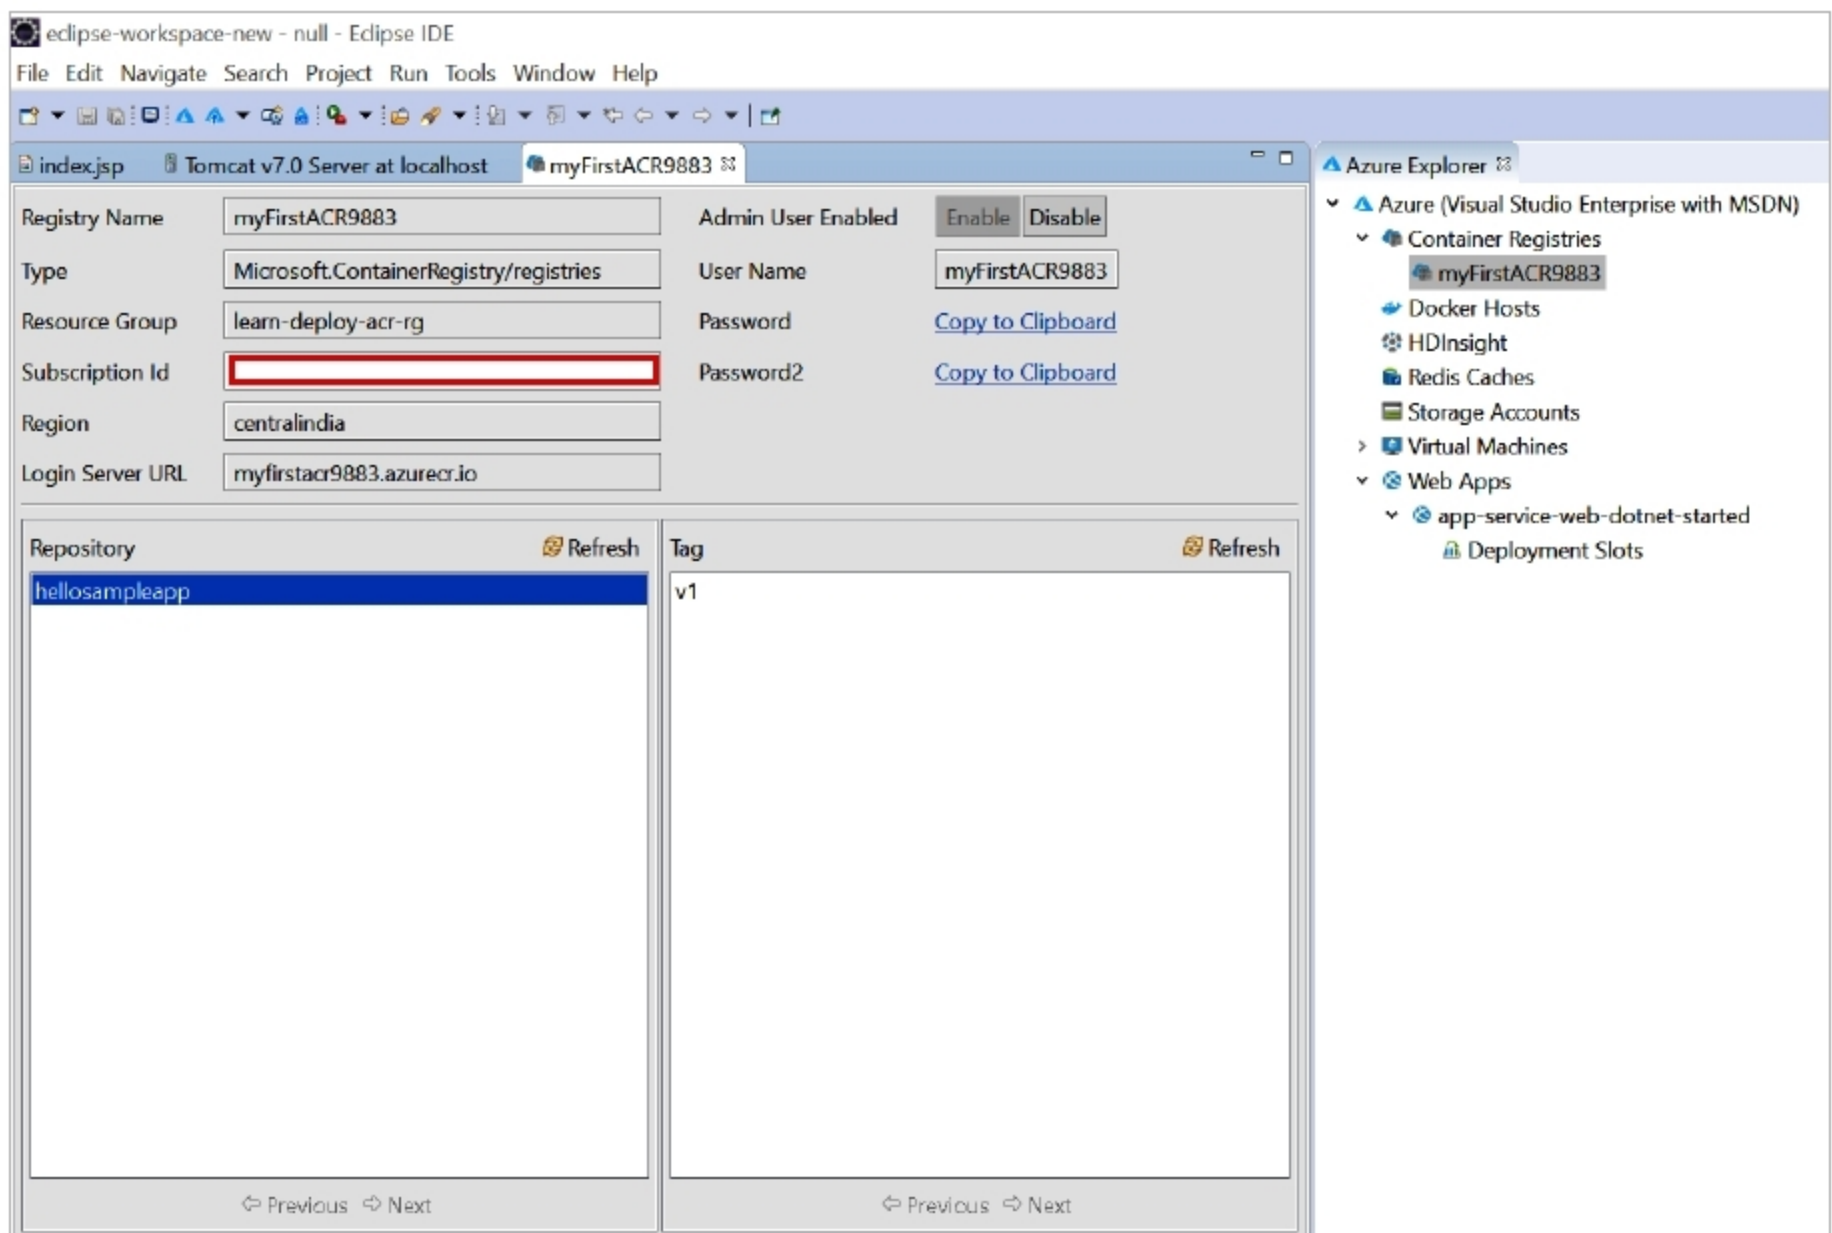

Figure 2: Microsoft Azure container registries

Visit the URL and enter the code in the browser when it asks for it. You will be redirected to *Login*. Provide the user name and password. Once login is successful, you will be asked to close the browser window or tab. Click *Okay* on the pop-up dialogue box and wait.

Step 14: The progress bar will indicate that processing is going on behind the scene.

Step 15: Select the *Project* and click *Finish*.

Table 4 lists the options available in Eclipse IDE for each project. Some operations are allowed from Eclipse IDE and some are redirected in the browser.

Eclipse and Microsoft Azure

Let's look at how to connect to Microsoft Azure Cloud and perform the available operations based on the plugin.

Step 1: Go to *Windows* -> *Show View*. Select *Azure*, and click on *Azure Explorer*.

The following services are available:

- Container registries
- Docker hosts
- HDInsight
- Redis caches
- Storage accounts
- Virtual machines
- Web apps

Step 2: Click on *Sign in*.

Step 3: It will open a dialogue box for authentication.

Step 4: Select *Azure Device Login* -> *Copy Code & Open*.

Step 5: Sign in with Microsoft Azure credentials.

Step 6: Select *Subscription*; it is

available in the dialogue box after authentication.

Step 7: Select *Container Registries*. We already have one container registry; so select and right click on it. Select *Open ACR Explorer* and verify the details.

Step 8: Select the Web app that is already available in Microsoft Azure. Right click on it and select *Show Properties*.

We can perform operations such as *Start*, *Stop*, *Restart* and *Delete Web App* from the Eclipse IDE.

Do verify other options available in Azure Explorer, such as the virtual machine, as an exercise. **END** 🐧
