Figure 1: Tabula portal

after extraction are shown in Figure 2.

After opening the Tabula directory, an .exe file is executed. On execution of *tabula.exe*, the Web based engine gets initiated. Once the Tabula engine is started, the Tabula application is opened on the Web browser with the URL <http://127.0.0.1:8080>.

On opening this URL on the Web browser, the Tabula application is loaded to extract the tabular data from the PDF files. The URL <http://127.0.0.1:8080> can also be opened as URL <http://localhost:8080> on the Web browser to extract, load and transform (ETL) the data from PDF files.

The PDF files from which the tabular data is to be extracted get imported in the Tabula dashboard on the Web browser (Figure 4).

After importing the PDF files to the Tabula application, the tabular data is automatically detected. On clicking 'Preview & Export Extracted Data', the tables are fetched from the PDF documents without any specific settings.

These tables can be transformed to CSV, TSV or JSON file formats so that the extracted data can be used for data analytics or plotting.
