

Why You Should Use A Backup Solution to Protect Your Cloud Data

Many organisations believe once their data is in the cloud their worries are over. The author, however, gives convincing reasons for organisations to invest in a cloud backup solution to ensure their data is not lost.

As a region, the Middle East has its own set of compliances and privacy requirements. One of the very stringent requirements is to keep its government, mission critical and public sector data resident within its areas of jurisdiction. For this reason, in the last few years, a number of cloud and infrastructure vendors have initiated rollouts to host their local editions in the region.

Gartner has forecasted that the Middle East and North Africa spending on public cloud services, including software, infrastructure, platforms and security, will cross the two-billion-dollar mark by 2020.

Overall, adoption, usage and spending on the public cloud has seen

consistent double-digit growth in almost every region of the world. The primary reason for this is the switch-over from an asset-based capital expenditure model for IT spending to an operating expenditure, pay-as-you-use model, which is provided by a public cloud type of consumption service. This reduces the burden of having a high initial expenditure outlay and a software vendor-based lock-in.

Consumerisation of IT, which is so much a part of the public cloud platform, continues to be an enabler for the double-digit growth of IT spending on this platform. On the flip side, it has opened the gates for a large number of users to come onboard and use the platform. While the number of cloud-enabled users

will boost collaboration and workflow inside an organisation, it exposes a wider segment of executives to the vagaries of an external environment.

Irrespective of the service-level agreements of uptime provided by cloud service providers, business organisations must have the complete copy of their cloud data accessible to themselves in the event of a widespread operational failure or unexpected litigation or force majeure of any sort. Recent global outages involving large cloud service providers, like the recent Google outage in April 2019, have led consultants to point out that losses from such prolonged incidents could run into tens of billions of dollars.
