

The Top Six IDEs for Raspberry Pi

An integrated development environment (IDE) is a software suite that provides the basic tools needed to write and test software. To write software, developers need tools that help to write and test the code, and these often include various libraries and code editors. In this article, we present the top six IDEs for Raspberry Pi.

Raspberry Pi is a small computer that has revolutionised the way children in schools learn computer science. It has proved to be a blessing for all software developers, and is now also being used in robotics. Raspberry Pi is extremely small – just the size of a credit card – and can be plugged into a standard PC keyboard or a TV. It is ideal for embedded projects and is very affordable.

The Pi has been successfully used by many people for various projects, starting from very basic items for children to complex tasks. Also, people with more advanced skills can transform it into a desktop computer that will run spreadsheets, write documents and perform other tasks that are generally expected of a PC. The Pi can also be used to play high-quality videos.

The top IDEs available for Raspberry Pi

The first thing to do when you start with programming is to get an IDE (integrated development environment). To make your Pi performs the tasks you

want it to, you have to write certain code and an IDE enables you to write, test and execute different code before implementing it. Raspberry Pi is compatible with several languages that can be used to write code.

Here is a selection of the top five Raspberry Pi IDEs.

BlueJ IDE

The BlueJ IDE was initially developed for educational purposes and was solely dedicated to Java. However, you can also use it for small-scale software development projects, and is ideal for such projects. BlueJ IDE is perfect for

someone who is just starting out with programming, or for those who want their children to learn to program.

BlueJ IDE is a successor of the Blue system and was developed by Michael Kolling and John Rosenberg in Australia. It has a very interactive and simple interface, which makes it easy to master when compared with other similar IDEs. BlueJ is portable and runs without installation on any OS, starting from MacOS to Windows. Also, it comes with technical support. The support team is very effective and responds to queries within 24 hours, any day of the week.
