

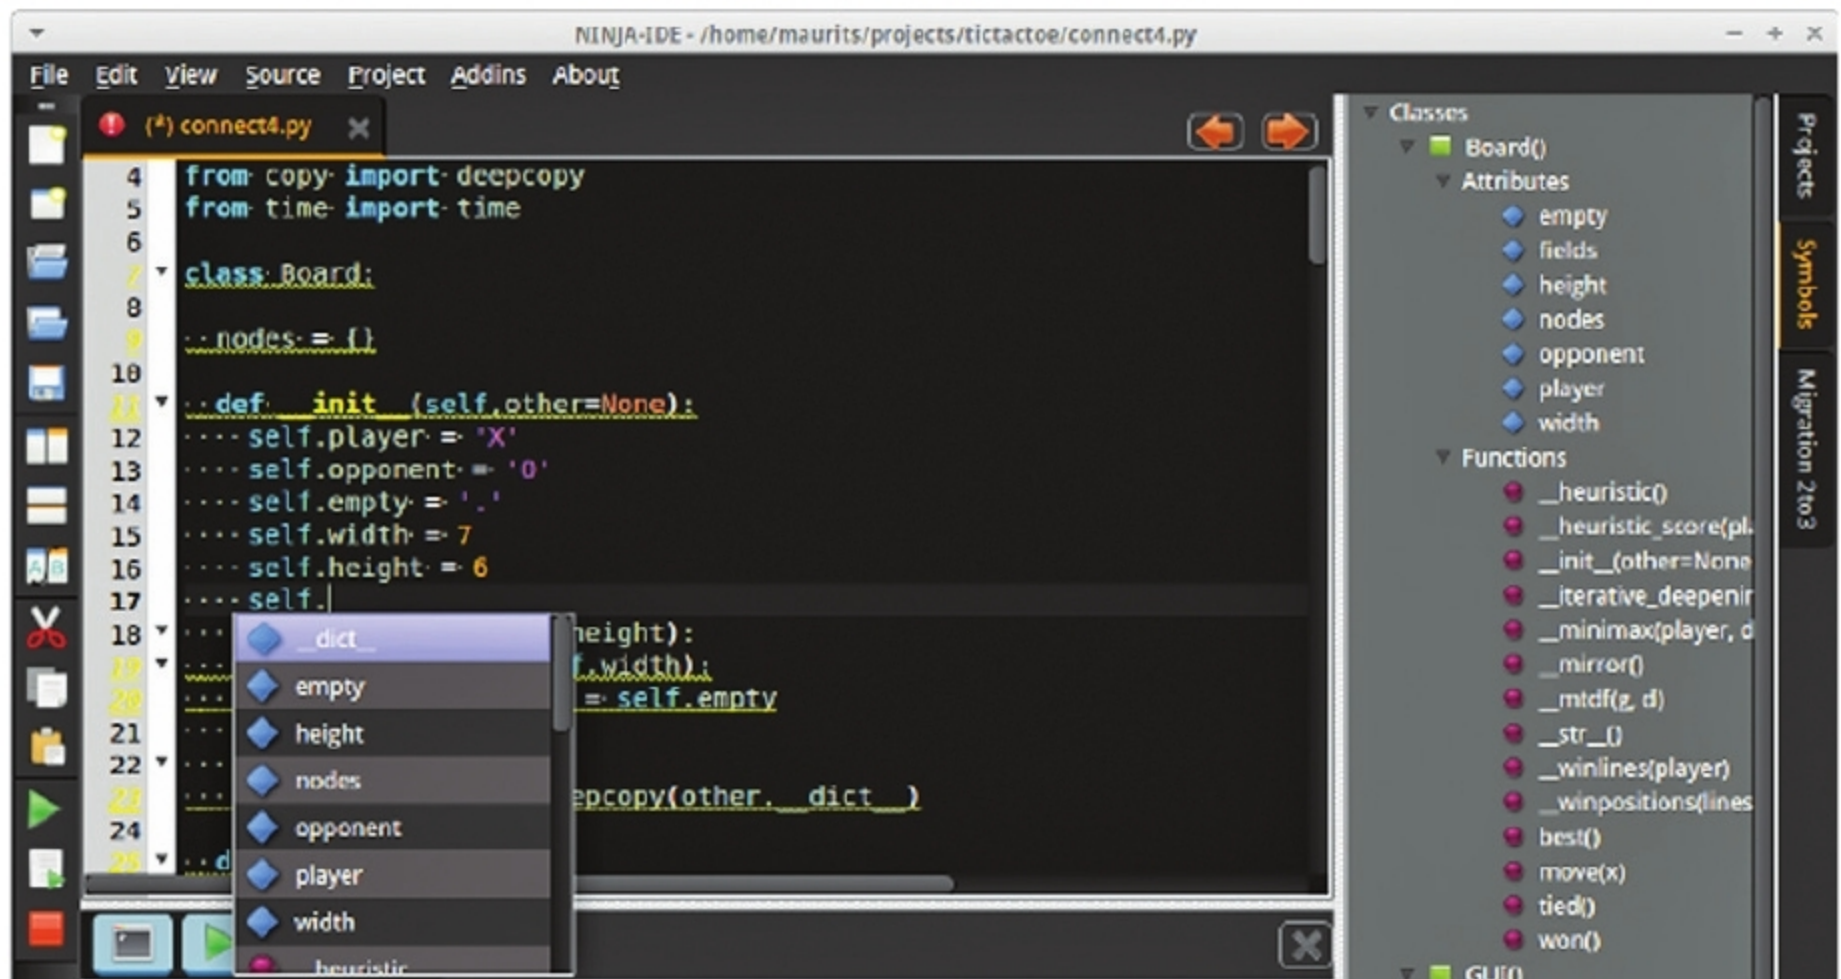

Figure 6: Ninja IDE

Greenfoot IDE

Greenfoot IDE was developed by Michael Kolling. It is a Java based cross-platform IDE, which was developed for use in high schools and for undergraduate students. Along with an easy to understand GUI interface, Greenfoot comes with automatic code completion, project management features and syntax highlighting.

This particular IDE is perfect for newbies and those starting out with programming. It is highly effective for executing Java code. Greenfoot supports KDE, X11 and the GNOME graphical environment. It is divided into two main classes — Actor and World. The latter represents the class where the main execution takes place, and 'Actor' stands for the object that exists in reality.

Code::Blocks IDE

Code::Blocks IDE was written using wxWidgets as a toolkit in C++ and was released in 2005. It is a cross-platform IDE that supports various compilers including Clang, Visual C++ and GCC.

This IDE is highly intelligent and can perform various functions like code completion, syntax highlighting and code folding. It comes with various external plugins that can be customised. You can run this IDE on Windows, Linux and MacOS. It supports various compilers starting with GCC, Borland C++, Intel C++ and many other computer languages. It uses custom-built systems and XML extension files to store information.

Ninja IDE

Ninja IDE is slightly different from other IDEs. It was designed by Diego Sarmentero, José Rostango, Horacio Duranm Gabriel Acosta and Pedro Mourelle. The IDE is written in Python and works perfectly on all operating systems. It has been specifically designed to create applications that are based on Python. Ninja is

extremely light and can perform functions such as code position, and tabs and file management. Apart from Python, the IDE also supports other computer languages.

Ninja is considered the most effective code editor, since it can perform complex functions, such as code completion and re-entry. One of its best features is that it helps to locate the static and PEP8 errors present in a file. The IDE comes with the code localisation function, which allows direct and fast access to any file. Users only have to type 'CTRL + K' and write what they are looking for, and the IDE will identify the text. Like most of the IDEs on our list, Ninja is also very easy to use. It comes with several unique and useful project management features along with useful add-ons that make the IDE highly extensible. **END**
