

THE TOP 10 OPEN SOURCE WEB DEVELOPMENT FRAMEWORKS FOR 2020

A new year has begun, bringing in new challenges. For a newbie Web developer, with such a wide array of choices available today, it can be daunting to decide which Web development framework would be the best one for career advancement. This article lists the top 10 Web development frameworks that hold promise for 2020.

When it comes to using an open source Web development framework, there are a wide array of choices available today. In this article, I hope to provide some clarity on which ones to use/learn in 2020. In order for readers to objectively analyse what would be the best option for them, I have come up with a list of the top ten that really stand out. I have listed them in the order of their relevance -- No.1 being the most relevant and No.10 the least.

Each framework has been analysed on the basis of five criteria, namely:

- Companies that use the framework
- Key features
- Community engagement
- Availability of learning resources
- Frequency of releasing new versions

10. CakePHP

CakePHP is an open source Web development framework. It is built using

PHP and follows the MVC (model-view-controller) model. It is good for building prototypes rapidly, and provides a wide array of built-in resources that are ready to use, such as translations, database access, caching, authentication, etc. It is used by Deloitte, Fusic and Adsia, as well as other companies in various capacities for Web development.

Key features:

- Uses PHP7
- Can be deployed fast to rapidly build prototypes
- Uses the MVC model
- Has many built-in modules that are ready to use
- Uses MIT licence

CakePHP has a fairly active online community, although immediate resolutions to issues may not always occur. The official repository of CakePHP on GitHub is used by 9.2K developers. Additionally, it has 3.4K forks. However, there is an observable lack of quality tutorials available for

CakePHP and there is a steep learning curve involved as you require a fair bit of familiarity with PHP. Typically, there is at least one release every month, with the latest version being v4.0.0.

CakePHP certainly brings a few unique qualities of its own to the table. However, it faces tough competition from the far more mature Laravel, which has a bigger following in the open source dev community with more activity and better tutorials being available. Learn CakePHP if you are already good with all the other frameworks discussed in this article.

9. Rails

Ruby on Rails (popularly known as Rails) is by far the most mature Web development framework in this list. It is a server-side Web application framework that follows the MVC model and provides default structures for databases and Web pages. Rails is used by many top companies such as Airbnb, Bloomberg and GitHub.
