

more sought after Web development framework, especially among the ever growing number of Python enthusiasts. Having said that, a huge chunk of the Internet still runs on PHP, so learning Laravel certainly has its perks.

5. Django

Django is the most famous Python based Web development framework out there. It is open source and free. The official Django website aptly defines its framework as ridiculously fast, reassuringly secure and exceedingly scalable. Instagram, Pinterest, Coursera, Udemy and many other big companies use Django for their Web applications.

Key features:

- Uses the MVC model
 - Python is easy to learn and skills based on it are highly sought after
 - Is highly secure
 - Django applications are scalable
- Django has an active and vibrant open source community. The official repository on GitHub is used by 339K developers and has 19.9K forks. Additionally, there are a huge number of quality tutorials available to learn Django online, for free. There are new releases almost every 10-15 days with the latest one at the time of writing this article being v3.0.1.

Even with JavaScript based frameworks becoming all the rage in the market, Django still remains very relevant in 2020 and will continue to be so in the future. It uses the power of Python and draws on its simplicity. Creating Django applications can be a fun and rewarding experience, especially if you are a Python enthusiast.

4. Vue

Vue is an open source JavaScript based library for building single-page Web applications. Though it is technically not a framework on its own, combined with a few other back-end tools, it

can act as a framework for your Web application. Since its initial launch in 2014, Vue has quickly risen to prominence in the Web development community. Grammarly, Nintendo, Adobe and GitLab are among the big companies that use Vue for building a reactive user interface.

Key features:

- The biggest advantage with Vue is that it is progressive, i.e., you can plug it into any Web app that is running on any framework without having to make changes to the latter
- You can isolate the use of Vue on your website to a single module if you want to
- Follows the MVV model
- Is reactive, i.e., fast and responsive to user input, regardless of network speed or latency

Vue has a great open source community with over 1.2 million developers using the official repository on GitHub and over 23.3K forks. You will find a multitude of great free tutorials online. Releases are slow, with one coming out every eight months or so. The latest release is v2.6.11.

The major selling point of Vue is its simplicity compared to React, which requires installation, whereas Vue is a plug-and-play library. The progressive nature of Vue, along with the convenience of JavaScript, makes the former a great choice to sharpen up your front-end skills. I highly recommend learning and using Vue in 2020 and beyond.

3. Express

Express is the most popular and, by all means, standard server framework for Node.js. It is open source and makes life super easy for Web developers by taking care of a lot of the jargon associated with setting up and deploying a Web application with Node.js. Intuit, OpenGov, Myntra, Accenture and BlaBlaCar are among some of the big
