

Lighttpd

Lighttpd is “a secure, fast, compliant, and very flexible Web server that has been optimised for high-performance environments.” It has a very low memory footprint compared to other Web servers and takes care of CPU load. Also called Lighty, it is an alternative to Apache Web Server.

The configuration file is `/etc/lighttpd/lighttpd.conf`, while the standard directory for files is `/var/www/localhost/htdocs/`.

Its advanced feature set (FastCGI, CGI, Auth, output-compression, URL-rewriting and many more) makes Lighttpd the perfect Web server software for every server with load problems.

Features

- Supports TLS/SSL with SNI via OpenSSL, server-side.
- Flexible virtual hosting, chroot support, authentication against LDAP server.
- Supports modules, WebDev, servlet, HTTP compression using `mod_compress` and the newer `mod_deflate`.
- URL rewriting and efficient event notification schemes like kqueue and epoll.

Latest version: 2.0

LiteSpeed Web Server (LSWS)

LiteSpeed Web Server (LSWS) is, as its name suggests, a lightweight Web server developed by LiteSpeed Industries Inc. and is compatible with commonly used Apache features, including `mod_rewrite`, `.htaccess`, and `mod_security`. LiteSpeed has become fairly popular and is capable of handling thousands of concurrent connections despite having a smaller memory. The purpose of introducing this Web server was to read Apache configuration files. However, according

to the company, a single LiteSpeed server is capable of handling data equivalent to two Apache servers.

LSWS 5.0 was the first popular Web server to support HTTP/2. An add-on with the 5.0 version is LiteMage Cache, which is a full page caching solution to enhance the speed of Magento stores. It is available as a free version as well as a paid option. LiteSpeed Web Server is a high-performance, highly scalable Web server. LSWS can load Apache configuration files directly and works as a drop-in replacement for Apache while fully integrating with popular control panels — replacing Apache in less than 15 minutes with zero downtime. Unlike other front-end proxy based solutions, LSWS replaces all Apache functions, simplifying usage and making the transition from Apache easy, while also allowing your team to move confidently with little or no retraining.

Features

- Supports HTTP/2, QUIC and HTTP/3.
- ModSecurity and Control Panel compatible, CloudLinux integration, Apache drop-in replacement.
- HTTPS / TLSv1.3 certificate, mass hosting support, zero downtime maintenance, fastest PHP, Ruby + Python app server.
- SSL handshake offloading, LSCache engine with ESI.

Latest version: 5.4.1

Eclipse Jetty

Jetty is an open source project providing an HTTP server, HTTP client and javax.servlet container capable of serving static and dynamic content either from a standalone or embedded instantiation. From Jetty-7 onwards, the Jetty Web server and other core components are hosted by the Eclipse Foundation.

Jetty is a lightweight, highly scalable Java based Web server and servlet engine. The primary objective is to support Web protocols like HTTP, HTTP/2 and WebSocket with high-volume low latency, providing maximum performance while retaining the ease of use and compatibility that's come from years of servlet development. Jetty is a modern, fully async Web server, which has a long history as a component-oriented technology that's easily embedded into applications while still offering a solid traditional distribution for Web app deployment.

Jetty has been designed for scalable performance under realistic loads of many simultaneous connections. It can achieve excellent results with many tens of thousands of HTTP connections and hundreds of thousands of simultaneous WebSocket connections. These benchmarks have been developed using real applications under realistic loads, and have been validated by real users achieving the same results in production environments. Unlike other Web server packages, Jetty has a remarkably small footprint. This allows both developers and administrators to deploy Jetty in their environments without worrying about unwanted overhead or memory usage. A small memory footprint also allows you to run more instances of the server on virtual hardware, which is often memory constrained, making Jetty very cloud friendly.

Jetty is used in products such as Apache ActiveMQ, Alfresco, Scalatra, Apache Geronimo, Apache Maven, Apache Spark, Google App Engine, Eclipse, FUSE, iDempiere, Twitter's Streaming API and Zimbra. Jetty is also the server in open source projects such as Lift, Eucalyptus, OpenNMS, Red5, Hadoop and I2P.

Features

- Asynchronous, flexible and extensible.
- Enterprise scalable, yet has a small footprint.
