# SUSE teams up with Karunya Institute of Technology and Sciences for cloud and open source learning

The SUSE Academic Program has signed an MoU with Karunya Institute of Technology and Sciences (KITS), Coimbatore, to collaborate for providing Linux and open source learning and skills to its students. The programme's aim is to give aspiring professionals the necessary technical expertise and help them access opportunities in the cloud job market. This will be done with the help of the 'SUSE Certified Administrator (SCA) in Enterprise Linux' certification.

According to a report by *CRN*, SUSE will support the programme with course materials for cloud-related technologies like DevOps, cloud application development, cloud administration and enterprise Linux. Marco Kraak, vice president of channels, SUSE EMEA and APJ, said that through the SUSE Academic Program, it is supporting academia to meet the changing demands of the digital economy. It is doing so by providing open source knowledge, training materials and an affordable education opportunity. He added that this will help students to explore job possibilities in the fast-growing technology space.

As a part of the programme, SUSE will provide staff and students with full access to technical training course libraries, curriculum, virtual labs and educational resources. It will also endorse and support the B. Tech and M. Tech in computer science and other related engineering courses offered by KITS. The faculty members will also be provided with technical experience and practice through a 'Train the Trainer' approach.

Rajarshi Bhattacharyya, country manager, SUSE India, said that by educating and preparing the next generation of professionals, the company is ensuring the future growth and adoption of open source.

## Amazon Web Services launches open source library, AutoGluon

A report by *Syncedreview* states that Amazon Web Services has launched an open source library named AutoGluon. This library will enable developers to implement deep learning models on image, text or tabular data by using a few lines of code.

## Catalogic Software announces open source disaster recovery tool, KubeDR

Data protection solutions provider Catalogic Software has launched KubeDR to provide backup and disaster recovery for Kubernetes cluster configuration, certificates and meta data. The company is also launching cLabs to support new products, open source initiatives and innovations.

Sathya Sankaran, COO of Catalogic Software, said, "Kubernetes has evolved into the *de facto* standard for deploying applications at scale, especially in the world of cloud and cluster computing. In response to market demand and to give back to the open source community, here at Catalogic, we are introducing KubeDR – a backup and disaster recovery solution specifically for etcd data in a Kubernetes cluster."

Kubernetes stores cluster data in etcd, an interface that collects configuration data for distributed systems. There are solutions focused on protecting persistent volumes but cluster configuration data is forgotten often in existing industry solutions. Catalogic said that its KubeDR is "user-friendly, secure, scalable and an open source solution for backup and disaster recovery designed specifically for Kubernetes applications."

Other features of KubeDR include its ability to back up cluster data in etcd to any S3 compatible storage, pause and resume backups, etc. It can also clean up older snapshots (based on retention setting), and restore etcd snapshot and certificates.
