

- OSGI, JNDI, JMX, JASPI and AJP support.
- Supports HTTP/2, WebSocket server, Java ServletAPI with JSP.

Latest version: 10.0.0

Official website: <https://www.eclipse.org/jetty/>

Cherokee

Cherokee is an extremely lightweight, efficient, fast, flexible, open source cross-platform Web server that runs on Linux, BSD, Solaris, OS X and Windows. It provides strong support for a wide range of technologies – FastCGI, SCGI, PHP, CGI, SSI, TLS and SSL encrypted connections, VirtualHosts, authentication, load balancing and Apache compatible log files. It handles concurrent connections on low memory, and enhances hardware performance with an easy-to-use GUI interface.

It has a completely new modular architecture with a neat and clean code base. Cherokee can be modified, updated and even extended to anything. It provides strong administration with wizards to configure the Web server to perform specific tasks or run frameworks and applications. These provide support for PHP through FastCGI, Ruby on Rails, ColdFusion, GlassFish, Django, Alfresco, GNU Mailman, .NET with Mono, rTorrent, Symfony, and Zend Engine, plus generic video streaming and uWSGI.

Features

- Reverse HTTP proxy, traffic shaping, authentication via htdigest, httpasswd, LDAP.
- MySQL, PAM, plain and fixed list.
- Server side includes (SSI) and on the fly gzip and deflate compressions.
- Chroot support, RRDtool statistics and the ability to launch Web applications on demand.
- Supports video streaming, content caching, etc.

Latest version: 1.2.103

GlassFish

GlassFish is an open source application server project started by Sun Microsystems for the Java EE platform, later sponsored by Oracle Corporation, and now hosted by the Eclipse Foundation and supported by Payara, Oracle and Red Hat. GlassFish is free software and was initially dual-licensed under two free software licences: the Common Development and Distribution License (CDDL) and the GNU General Public License (GPL) with the classpath exception.

GlassFish supports Enterprise JavaBeans, JPA, JavaServer Faces, JMS, RMI, JavaServer Pages, servlets, etc. This allows developers to create enterprise applications that are portable and scalable, and which integrate with legacy technologies. Optional components can also be installed for additional services.

In fact, GlassFish is more than just a generic Java EE application server. It's the reference implementation of the Java EE standard. This means that GlassFish is used to showcase Java EE capabilities, and it gets contributions from the same people who define Java EE standards. Therefore, GlassFish will always support the latest Java EE features first.

GlassFish server supports Java EE 7, which provides the basis for delivering dynamic and scalable hypertext language applications. For example, the Java API for WebSocket allows bi-directional low-latency communication, while the Java API for JSON processing simplifies information analysis for transportable applications. The Java API for RESTful Net Services 2.0, the performance utilities for Java EE and Servlet 3.1, add competency options to change extremely scalable applications to handle additional HTML5 buyers at the same time. The modular design of GlassFish is based primarily on the standards of the OSGi Alliance and ensures that the GlassFish server only starts with the modules than the square footage required for application that only measures the measurement. As a result, the boot times and the memory consumption decrease.

Features

- Lightweight and extensible core, based on OSGi Alliance.
- Web container with easy-to-use admin console.
- Highly available clustering and load balancing.

Latest version: 5.1
