

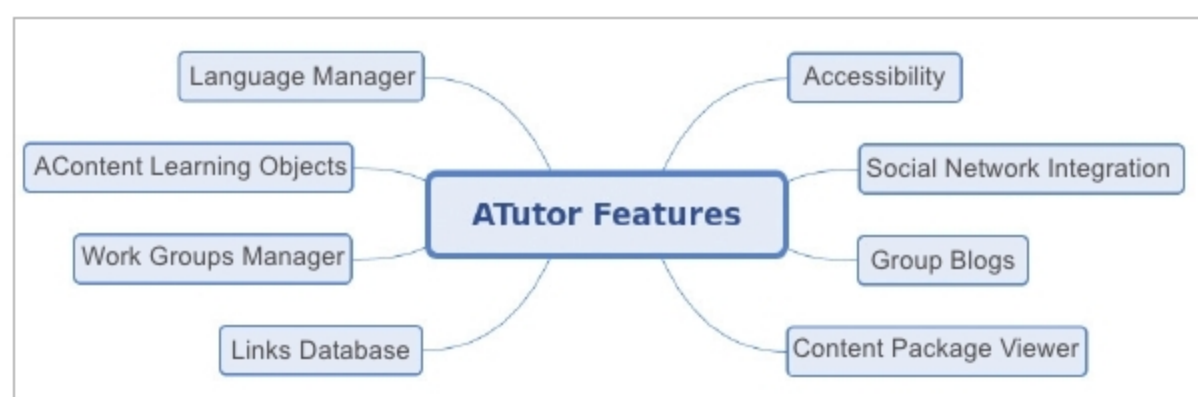

Figure 4: ATutor's features

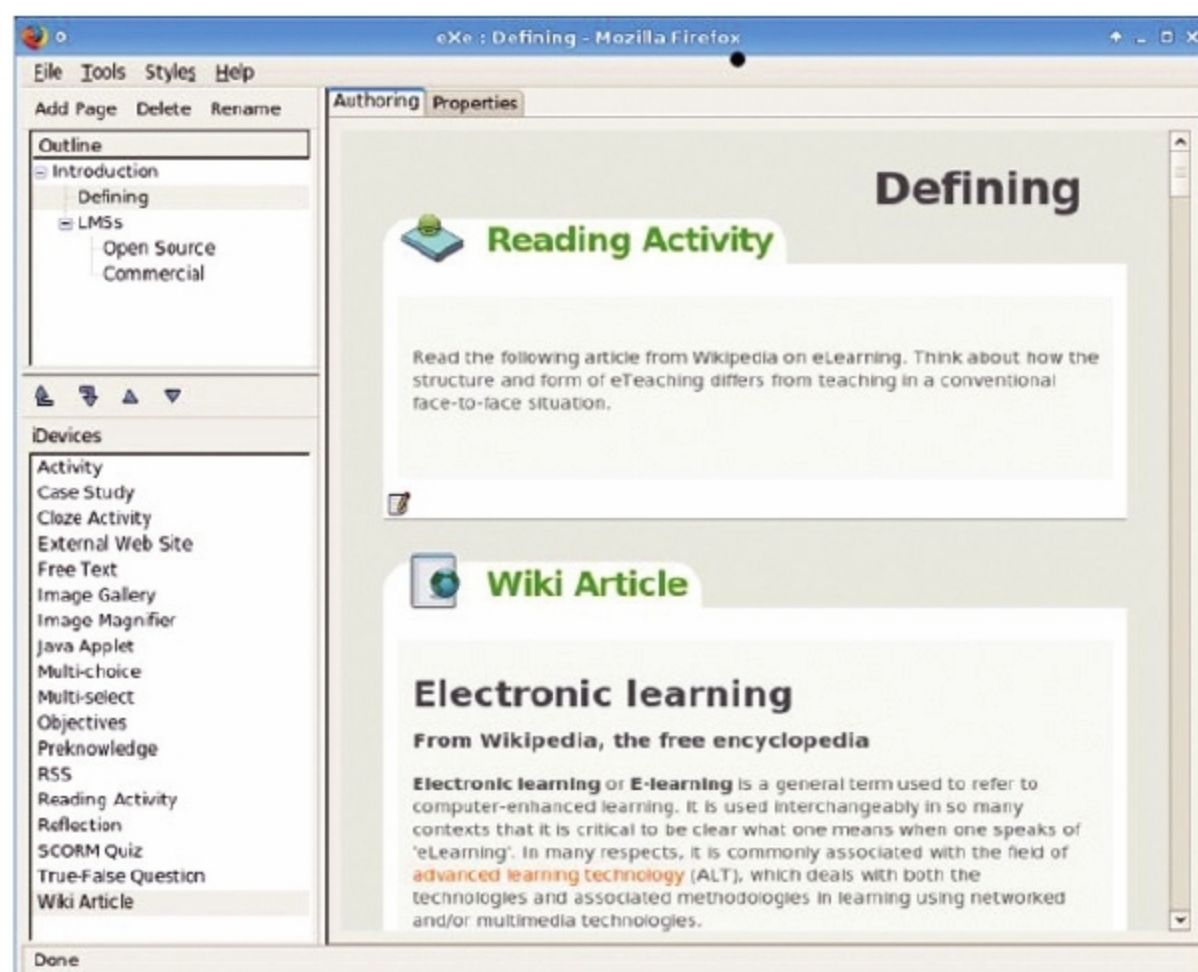

Figure 5: exeLearning

version of Sakai. Its core features are:

- Communication and collaboration
- Grading and assessment
- Content development and delivery
- External app integrations
- Course and systems management

You can check out the two different variants of Sakai at <https://www.sakailms.org/try-sakai-lms-free>. These are:

- Cloud hosted, where we can create an account and see the features of Sakai in action.
- Self-hosted, which allows us to download and configure the Sakai LMS on our system.

ATutor: ATutor is another powerful LMS which is open source. One of

its important characteristics is the accessibility provided for persons with disabilities. ATutor was developed by the Inclusive Design Research Centre, OCAD University (Ontario, Canada). The latest stable release is 2.2.4, which came out in June 2018. The core of ATutor is written in PHP. It is available with a GNU General Public License. ATutor can be downloaded from <https://atutor.github.io/>.

The core features of ATutor are:

- Accessibility
- Social network integration
- Group blogs
- Content package viewer
- Links database
- SCORM manager

- Work groups manager
- Learning object repository
- Language manager

If you want to try a live demo of ATutor, go to <https://atutor.github.io/atutor/demo.html>.

Apart from these two tools, the open source world offers a lot more, such as a Web content creation tool called exeLearning, GeoGebra to assist math teachers, Elgg for more effective social media communication, and OBS Studio for screencasting and streaming. These tools have been explored here.

exeLearning for content creation

Content authoring is an important component of the e-learning process. exeLearning is an open source content authoring tool. Its primary objective is to assist course teachers to publish Web content without having to master the markup languages such as HTML or XML. The content created using exeLearning can be exported in various formats such as an IMS content package, SCORM 1.2 or as simple modular Web pages.

The exeLearning project was funded by the New Zealand Government Tertiary Education Commission's e-collaboration grant. The University of Auckland and the Auckland University of Technology were involved in leading the project.

A simple and powerful introduction to exeLearning is available in the video link at <https://youtu.be/yynnOC6ecR4>.

eXe is an e-learning XHTML editor. It is a very powerful and intuitive tool for e-content creation. It's a multi-platform tool that can be installed in all major operating systems such as Linux, Mac and Windows. Platform-specific versions can be downloaded from the official website <https://exelearning.org/> (Figure 5).

GeoGebra for teaching maths

If you are teaching subjects that involve specialised types of content such as
