

The *a-update* function takes four arguments — a collection, a key, a function and additional arguments to the function. It applies the function with its arguments to the specified key and returns a new collection. A couple of examples are provided below:

```
(a-update collection key function
arguments) ;; Syntax
```

```
(a-update (a-list :name "Mr. ") :name
'concat "Jack")
((:name . "Mr. Jack"))
```

```
(a-update (a-hash-table :name "The Big
") :name 'concat "Bang Theory")
(:name "The Big Bang Theory")
```

The *a-update-in* function is similar to the *a-update* function, except that it can update a value in a nested collection. An example each for an association list and a hash table is given below:

```
(a-update-in collection keys function
```

```
arguments) ;; Syntax
```

```
(a-update-in x [:foo] '+ 1)
((:foo . 2) (:bar . 2))
```

```
(a-update-in h [:a] '+ 1)
(:a 2 :b 2)
```

Tests

The a.el project contains tests that you can run with Cask and ert-runner. You need to first clone the source code repository using the following command:

```
$ git clone https://github.com/plexus/a.
el
Cloning into 'a.el'...
remote: Enumerating objects: 118, done.
remote: Total 118 (delta 0), reused 0
(delta 0), pack-reused 118
Receiving objects: 100% (118/118), 44.86
KiB | 740.00 KiB/s, done.
Resolving deltas: 100% (62/62), done.
```

If you do not have Cask, install the same using the instructions provided in

its README file at <https://github.com/cask/cask>.

You can then change directory into the cloned a.el folder and run *cask install*. This will locally install the required dependencies for running the tests.

You can now simply run *cask exec ert-runner* from the top-level sources directory to execute the tests as shown below:

```
$ cask exec ert-runner
Running tests on Emacs 26.3
Loading /tmp/a.el/a.el (source)...
.....
Ran 17 tests in 0.003 seconds
```

You are encouraged to read the source code at <https://github.com/plexus/a.el/blob/master/a.el> to know more about the available functions provided by a.el.
