

WhiteSource and Codefresh team up for built-in security and licence management in CI/CD pipelines

Open source security and licence compliance management company, WhiteSource, has come up with a new integration feature with Codefresh, the Kubernetes-native continuous integration and continuous delivery (CI/CD) solution. The integration aims to help customers to build open source security and licence management within their native Codefresh CI/CD pipeline.

David Habusha, WhiteSource VP of product, said, "We are always working to provide development teams with the tools that allow them to easily fuse security into their DevOps pipelines. We are happy to partner with Codefresh to provide all our customers with an integration that provides an open source security scan in one simple click. Now, even more development teams and organisations can harness the power of open source and be confident that their CI/CD processes remain swift and secure."

According to the company, the new integration will help Codefresh customers to continuously secure and manage their applications' dependencies and Docker images as part of their native Codefresh CI/CD workflow. The company claims that teams will be able to quickly and seamlessly integrate open source security tracking into their Codefresh pipeline without slowing down for the purpose of security.

The report said that the AEM authoring toolkit will generate AEM components dialogues and in-place editing facilities based on annotations added to backend Java classes. It will also relieve AEM developers from writing down the complex XML markup for the authoring interface, which will prevent the creation of difficult-to-trace errors. The toolkit will work with AEM 6.4 and on JDK 1.8+ in any operating system. The company has also developed other open source projects like Exadel Developer and Exadel RichFaces.

Integrated geospatial data platform, India Observatory, launched

India's first open source, integrated, geospatial data platform called India Observatory has been launched in Hyderabad. A TOI report said that the observatory has detailed information on India's social, ecological and economic

parameters, and has been designed to help in local level decision-making by village communities, panchayats, NGOs and government officials.

The platform contains data on over 1,600 parameters, from the village to the national level, in the form of maps, graphs and infographics. The platform

is available for civil society organisations, students, government departments and citizens, the report stated.

As per the report, the India Observatory will also be able to function offline. It will be available in local languages to ensure accessibility for everyone.

Logz.io launches open source cloud observability platform

Open source based log management and cloud security provider Logz.io has launched a cloud observability platform which has been powered by the open source ELK stack (comprising Elasticsearch, Logstash and Kibana) as well as Grafana. According to a report by GlobeNewswire, the platform will enable engineers to reduce time to resolution, increase their productivity, and integrate security into DevOps workflows. The platform will be delivered as a fully managed, developer-centric cloud service with a single pane of glass for monitoring, troubleshooting and securing distributed cloud workloads and Kubernetes.

The platform will have three offerings – log management, infrastructure monitoring, and cloud security information and event management (SIEM). The log management will provide the ELK stack as a fully managed service, and enhance it with AI and advanced data analytics features, claimed the company.

The infrastructure monitoring, which is available in beta mode, will provide a Grafana-based monitoring solution that will correlate metrics and logs to speed investigative work and time to resolution. The cloud SIEM will provide DevOps-native threat detection and analytics built on the ELK stack.

The company said that the observability platform is powered by Kibana and Grafana, and will help engineers to correlate between metrics and logs by
