

DVD OF THE MONTH

Linux for everyone.

Elementary OS 5.1 Hera

This is a fast, open and privacy-respecting replacement for Windows and macOS. Elementary helps you to stay productive and focused with multi-tasking view, picture-in-picture, do not disturb, and more. It also keeps work out-of-sight when watching videos or playing games. It comes with a carefully considered set of apps that cater to every day needs, so you can spend more time using your computer and less time cleaning up bloatware.

Univention Corporate Server 4.4.3

Univention Corporate Server is an enterprise-class distribution based on Debian GNU/Linux. It features an integrated management system for the central administration of servers and Microsoft Active Directory-compatible domain services. It supports the parallel operation of virtualised server and desktop operating systems.

Sugar on a Stick (SoaS)

Sugar on a Stick is a Fedora based operating system featuring the award-winning Sugar learning platform and is designed to fit on an ordinary USB thumbdrive ('stick').

Sugar sets aside the traditional 'office-desktop' metaphor, presenting a child-friendly graphical environment. Sugar automatically saves your progress to a 'Journal' on your stick, so teachers and parents can easily pull up "all collaborative Web browsing sessions done in the past week" with a simple query rather than memorising complex file/folder structures. Applications in Sugar are known as activities.

openmediavault 4.1.29

openmediavault is the next generation network attached storage (NAS) solution based on Debian Linux. It contains services like SSH, (S)FTP, SMB/CIFS, DAAP media server, RSync, the BitTorrent client, and many more. Thanks to the modular design of the framework, it can be enhanced via plugins.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
