

providing complete visibility into Kubernetes and distributed cloud workloads. The platform also features out-of-the-box proactive alerting and advanced machine learning capabilities for engineers to identify and resolve issues and threats faster, the company claims.

Cooperatives Europe developing OSS called Knowledge Base

Cooperatives Europe is developing a new open source software called Knowledge Base to allow users to index co-op information and resources in a standardised manner. A report in *thenews.coop* said that the software is in its final stage of development, and is aimed at mentors and youth organisations that support young co-operative entrepreneurship.

The company added that the Knowledge Base source code is already public and available. As per the report, it has been built with two main components which are the front-end (interface) and back-end (the indexing system and management part). The company is developing a WordPress plugin, the code for which is free and available.

According to the report, the company said that by using the software, co-op mentors will be able to reference existing material on co-operative entrepreneurship or find important publications in many languages, within seconds. Users will also be able to contribute to the Knowledge Base by sharing resources and information.

Cooperatives Europe has said that making the resource open to all is in sync with the fifth cooperative principle of providing education, training and information. The software can be used and re-purposed by the public, according to their needs and infrastructure.

Alibaba Cloud open sources ML platform Alink on GitHub

According to a report by *Indo-Asian News Service*, Alibaba Cloud has released a self-developed machine learning (ML) platform named Alink on GitHub. The platform will provide a range of algorithm libraries that will support both batch

and stream processing. The company said that this will help in machine learning tasks like online product recommendation and intelligent customer services.

Yangqing Jia, president and senior fellow of data platforms at Alibaba Cloud

Intelligence, said, "As one of the top 10 contributors to GitHub, we are committed to connecting with the open source community as early as possible in our software development cycles. Sharing Alink on GitHub underlines this long-held commitment of ours."

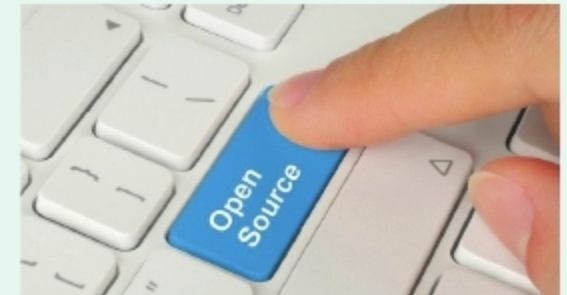

GitHub has entered India and started operations here. According to reports, India has the third largest community of developers on GitHub. Alink has already been deployed by various businesses within the Alibaba ecosystem.

Duke University launches open source learning toolkits

Duke University has launched an open source, next-generation digital learning environment called Kits. A report by *IBL News* said that Kits has been built with Ruby on Rails (as the backend framework), React (the front-end framework), Grouper (for group management), Shibboleth (SSO) and learning tools interoperability (LTI).

CISA and VotingWorks open source post-election auditing tool Arlo

According to a report by *ZDNet*, the US Cybersecurity and Infrastructure Security Agency (CISA) and VotingWorks have open sourced Arlo, a tool for the post-election auditing process. The tool has been made available on GitHub. Arlo was created by VotingWorks and CISA has adopted the tool.

Currently, US state election officials are being convinced to deploy it before next year's presidential election.

Arlo is a Web based app designed specifically for the US election process in which votes are tallied electronically using software or special machines. To prevent any faulty voting systems or hacking during the process, the US government makes it compulsory that all counted votes go through a post-election audit called Risk-Limiting Audit (RLA) to verify the results.

As per the report, Arlo is designed to automate this auditing process by selecting random voter ballots for the RLA process. This will give auditors the information they need to find those ballots in storage and help officials compare audited votes to tabulated votes. This facility will help in monitoring and reporting capabilities for election officials and public observers to follow the audit's progress and outcomes.

As a part of the pilot programme, Arlo is being tested in Pennsylvania, Michigan, Missouri, Virginia, Ohio, and Georgia. Microsoft had also done something similar earlier this year. It had open sourced ElectionGuard, software developed in-house to run on voting machines.
