

Financial: In financial services, the model is designed to help financial service companies map buyer personas and anticipate customer behaviour. AI-enabled financial service companies can validate real-time business decisions within seconds.

Railway system: Use of AI within the rail sector is critical to making the rail experience more intuitive, and to eliminate many of the problems faced by passengers. Computational intelligence (CI) is used to forecast problems in railway maintenance, which is important and critical for safe, comfortable and economic transportation.

Before making any decision, reasoning is an essential step to explore the links between AI and decision-making. There are two aspects of decision-making: diagnosis and look-ahead. AI has many relationships with diagnosis involving

expert systems, case-based reasoning, fuzzy set and rough set theories; and look-ahead reasoning involving uncertainty and preferences.

Traditionally, human operators have had to rely on inconsistent and incomplete data. With AI, data-based models and simulations are now being used to solve various problems.

Healthcare: AI is critical here because less accurate or unreliable results will put patients at risk. Therefore AI has to be accurate, and safe AI programs need to be trained, or at least constantly updated, to be able to identify new and exceptional health cases.

Remote AI-assisted robotic surgeries have been successfully carried out by many experts across the globe. With technology advancements, AI has helped personalised healthcare services,

reduced the time to look for information that is critical to decision-making and facilitated better care for patients.

One of the more critical applications of AI in healthcare is ensuring security of data and solutions.

While we are smarter and more intelligent than present machines, AI technology certainly helps us in the decision-making process to achieve better outcomes. Mission-critical applications require smarter decisions, and better accuracies and results. Although AI machines are used in many applications, very critical applications require the intervention of human operators. **END**

beforehand and predict its success rate without actually performing the operation. The developers come with skills such as programming for image processing, 3D imaging, simulation and significant application development. The median salary that could be expected is in the range of ₹ 700,000-1.1 million (7-11 lakhs) per annum.

9. Drone developer

The newest entry to this list of in-demand jobs is the drone developer. Drones have become quite a rage and are being used in areas ranging from sports to inspection of plant or machinery where human entry is not possible. With Amazon and other tech giants announcing deliveries using drones, the demand for drone developers is undoubtedly rising. A drone developer comes with skills to develop applications that can handle drones and is also able to build drones

for various business requirements. The median salary is still not clear, but as the industry evolves, benchmark salaries will become established in the coming years.

10. DevOps engineer

No matter what technological changes occur, the cloud is here to stay and almost all the applications and business infrastructure will be shifted to it sooner than later. The demand for DevOps engineers will go up and it's worth being prepared for this. A DevOps engineer's challenge is to look after the build, deployment, operation, monitoring and other infrastructure related issues. The skills required are

knowledge about the infrastructure, scripting and programming skills, collaboration skills, and so on. The average salary of a DevOps engineer is ₹ 569,000 (5.69 lakhs) per annum.

In the future, we can expect more job roles as tech advances take place. Some roles that could emerge in the future are digital growth hacker, quantum computing expert, driverless car developer, engine-less car developer, mobility developer/consultant, etc. And some skills will always be in demand, no matter what comes into the market next. These are full-stack developer job roles, data architects/engineers, DBAs, project management experts, etc. **END**
