

Eclipse Foundation launches Edge Native Working Group to drive open source adoption

According to a report by *GlobeNewswire*, the Eclipse Foundation has launched the Edge Native Working Group, which is a vendor-neutral and code-first industry collaboration that aims to push the adoption of open source software in edge computing. The founding members of this project include Adlink, Bosch, Edgeworx, Eurotech, Huawei, Intel, Kynetics and Siemens.

The Edge Native Working Group has been created to focus on the near-term creation of an end-to-end software stack that will support deployments of technologies like IoT, AI and autonomous vehicles, among others.

Mike Milinkovich, executive director of the Eclipse Foundation, said, “Within the Eclipse community, we already have a mature code base of open source edge computing platforms with production deployments in the field. The Eclipse Foundation is happy to host this vendor-neutral industry collaboration to accelerate the adoption of distributed applications at the edge.”

The working group will look after two flagship projects presently at the Eclipse Foundation – Eclipse ioFog and Eclipse fog05, as well as other projects that are yet to be announced. The group will also focus on the development of various layers of software at the network edge that will help others to build customised applications for their own specific implementations. This will include applications for retail, carrier environments, 5G, IoT, Industry 4.0 and smart manufacturing deployments.

Twitter to fund development of open source social media standard

Jack Dorsey, CEO of Twitter, tweeted that the company is going to fund a small independent team of up to five open source architects, engineers and designers to develop an “open and decentralised standard for social media” – a project that will be called Bluesky.

Malaysia to adopt open source for its national biometric system

The Malaysian Administrative Modernisation and Management Planning Unit (MAMPU) aims to use the biometric digital identity system in the country to ensure 40 per cent of government services are available online, end-to-end, by the close of 2020. The report said that MAMPU is using open source technologies for this instead of relying exclusively on the proprietary systems of vendors.

A report by GovInsider stated that Dr Suhazimah Dzazali, deputy director general for information and communication technology, said that open source has helped in enabling more agile processes and in developing the capabilities of the public sector office. He added that open source has enabled this due to the effective use of resources.

As per the report, Hanissull Jalis bt Md Yusof, deputy director, application development division, said that previously, the division used resources provided by its data centre and built applications on traditional virtual machines. He stated that the growth was restricted by funding availability and a lack of staff with Linux, middleware and cloud skills.
