

Netflix open sources Python library, Metaflow

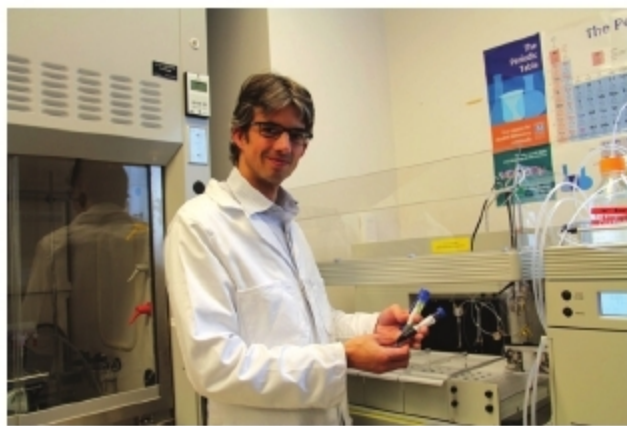

Netflix has made the Python library Metaflow open source. Metaflow helps scientists and engineers build and manage real-life data science projects. Netflix is one of the biggest users of Amazon Web Services (AWS). To make Metaflow open source, Netflix partnered with AWS to integrate Metaflow and various AWS services. It has made the code available on GitHub.

A report by Packtpub said that Metaflow was developed by Netflix to boost the productivity of data scientists whose projects range from classical statistics to deep learning. It provides a unified API to the infrastructure stack required to execute data science projects from prototype to production. The strength of Metaflow is its integrated full-stack, human-centric API.

Metaflow provides a unified approach to navigating the stack. It is more prescriptive about the lower levels of the stack but is less opinionated about the actual data science at the top of the stack, claims the company. The report also said that developers can use Metaflow with machine learning or data science libraries like PyTorch, Tensorflow or SciKit Learn.

SFU and collaborators create open source database on natural microbial compounds

According to the website of Simon Fraser University (SFU, at British Columbia, Canada), Roger Linington, an associate professor at SFU and a team of

international collaborators have together created an open source database called Natural Products Atlas covering nearly 25,000 natural compounds. This will act as a repository for the global scientific community.

The site will feature various interactive visualisation tools to explore the chemical diversity of

natural microbial products. It is fully searchable and downloadable, and will let researchers filter data from an array of various perspectives.

The Linington Laboratory at SFU will maintain the Natural Products Atlas. It plans to create cross-platform links and upgrade further to speed up natural products research. Linington said that he expected that researchers will add approximately 1,600 new compounds to the database each year. He added that existing databases are not designed for researchers to collaborate and share their discoveries with each other or to work on large-scale projects and broad-scale annotation.

Exadel releases Adobe Experience Manager authoring toolkit

According to a report by Aithority, digital software engineering solutions provider, Exadel, has launched an open source project – the Adobe Experience Manager (AEM) authoring toolkit. This will be available as a packaged, fully supported solution to Exadel's enterprise clients and as an open source tool for the community.

The toolkit supports the automatic and extendable generation of UI elements for AEM authors. It also provides a next-gen authoring experience in Adobe's Coral UI-powered environment. The toolkit has been developed and maintained by the Exadel digital marketing technology team.
