

SUSE said that it will combine Elektrobit's automotive experience with its leadership in delivering mission-critical Linux and container technologies to provide a future software platform for automobiles. This platform will aim to fulfil the key requirements around openness and transparency, as well as seamless system updates over the air through a broad open source community that provides constant innovation and a large talent pool.

Software-defined vehicles involve new experiences for both manufacturers and drivers. SUSE said that car owners will no longer need to sit at the auto shop

to replace outdated firmware.

Maintenance and features will be delivered not through an appointment with a dealer, but automatically, over the air. Autonomous driving means software-driven cars. SUSE said that Linux will hold the central position to ensure the performance, safety and security of that software.

SUSE added that even the best, most rigorously tested software needs to be maintained and bugs need to be fixed. Security gaps that are discovered years after initial deployment have to be patched and permanently closed. SUSE said that its technology will power autonomous driving and deliver a technology platform that everyday consumers will depend on for their transportation needs.
