

Functional Architecture

Figure 3: Functional architecture

Functional architecture

MOSIP is built on the kernel, so there is security, privacy auditing logs, language translation and transliteration, a notification engine to send SMSs, and email as well as master data.

MOSIP 1.0 is available for download under the MPL 2.0 licence. The GPL 2.0 licence was avoided because any commercial enterprise that might want to write applications over the MOSIP code, but keep its application proprietary, may do so under MPL 2.0. Enterprises have to distribute the MOSIP code and documentation as open source. For example, if your bank has built a loan portfolio on top of MOSIP, then it can secure only that loan

application as a separate entity.

Building on top of a core technology layer

The MOSIP platform is the core technology layer that a systems integrator can customise and configure for a specific country. And on top of it, you can have a lot of ID linked services which could be in education, health, fintech, ration distribution or eKYC.

Two countries have so far signed an MoU with IIIT-B for MOSIP: Morocco and the Philippines. In fact, the UN High Commission for Refugees wants to implement an ID system for refugees. The World Food Programme is also in talks with us.

For the complete details on MOSIP, you can visit <https://www.mosip.io/>.

Note: This article is a transcript of a talk given by Dr S. Rajagopalan during Open Source India 2019 at the NIMHANS Convention Centre, Bengaluru. The talk has been transcribed by Vinay Prabhakar Minj of the OSFY editorial team.
