

Payara splits its open source product offering into enterprise and community editions

Global open source company Payara Services has rolled out two separate software editions of the Payara Platform from June — the Payara Platform Enterprise Edition and the Payara Platform Community Edition.

The Payara Platform Enterprise is designed to increase stability and security in production environments, allowing access to production-oriented features, tools and capabilities. The Payara Platform Community is targeted at developers looking to play around with the latest features and APIs during development, company sources announced.

Steve Millidge, founder of Payara Services commented, “This change to Payara Enterprise and Payara Community simplifies our product offering and delivers benefits to all users of the Payara Platform. Community users get more frequent releases, delivering the opportunity to experiment with the latest and greatest technologies faster. Payara Enterprise customers get a simplified product with the benefits of both of our current streams, production-ready software that delivers new capabilities and is ready for mission-critical operational environments.”

The company said that now the Stability Stream and Features Stream will combine to form Payara Platform Enterprise. It added, “Instead of having to choose between the potential instability of the Features Stream or having no new features for 12 months in the Stability Stream, customers will receive the benefits of both with Payara Server Enterprise or Payara Micro Enterprise.”

Apple launches Password Manager Resources

Apple has created a new open source project called Password Manager Resources to help developers create stronger passwords for its users. Apple has made this available on GitHub, and has said that this will help developers of password managers to collaborate to create strong passwords that are compatible with popular websites.

Google makes internship programmes virtual

Google has announced that its summer internship programme will be held this year as well, despite the COVID-19 pandemic. It added that it will be held virtually and the focus is on WFH open source projects.

The company wrote in its blog, “This is the first year our summer internship programme is virtual, but what it means to be an intern at Google hasn’t changed—we want our interns to have fun and make an impact on products that people use every day. Although many aspects of the programme remain the same with interns working from home, we had to make some adjustments. Interns will not have the benefit of working next to experienced Googlers in a traditional office environment, which in turn impacts the kinds of projects they can work on. Rather than cancel or postpone our programme, we did what we’ve done many times before at Google—came up with a Plan B.”

Google also said that this year, many technical internships will focus on open source projects. It added that open source is a model that makes a product’s underlying code available for anyone to work on. Even though interns didn’t have access to certain technical resources in a Google office, they could still contribute to meaningful projects.
