

it neither uses WebView nor the OEM widgets that are shipped with the device. Instead, it has its own high-performance rendering engine to draw widgets. It uses the Dart programming language to implement its system, using animation, gestures and widgets that can be easily read, changed, replaced, or removed.

Flutter configuration for the Android Studio IDE

Here are the step by step instructions to configure Flutter for the Android Studio IDE.

1. To download the Flutter Software Development Kit for Windows, go to its official website, click on the 'Get started' button, and then click on the Windows icon to download the latest Flutter SDK.
2. After the download is completed, extract the Zip and place it in an appropriate folder. To run the Flutter command from the console, update the system path command to include the *flutter bin* directory.
3. Next, open the Windows command prompt and run the `$ flutter doctor` command to check Flutter app development and the report on the installation process.
4. Now, open Android Studio and then go to *File -> Settings -> Plugins*.
5. Search for the Flutter plugin and click on 'Install'. It will also ask for the Dart plugin.
6. Restart Android Studio, click on *File-> New-> New Flutter Project* and choose the Flutter application from the next wizard.

Advantages of the Flutter framework

- The application development process is extremely fast with Flutter because of the hot-reload feature. Changes or updates to the code are reflected as soon as they are made.
- Applications developed using Flutter run faster compared with
