

Red Hat certifies Cyber Armor as OpenShift operator

Cyber Armor, which helps DevOps teams to deploy natively zero-trust workloads across cloud-native and hybrid environments, has received the Red Hat Operator certification for OpenShift. This collaboration will extend Cyber Armor's security technology to Red Hat enterprise customers.

Shauli Rozen, Cyber Armor CEO and co-founder said, "A Red Hat Certified Operator for OpenShift helps to lay the groundwork for strengthening security for an IT world built on hybrid and multi-cloud deployments, enabling OpenShift users to add zero-trust based security to their cluster with a click of a button. We look forward to years of fruitful collaboration with Red Hat."

The Cyber Armor cloud workload and data protection streamlines DevOps and security. It provides solutions for effortless

zero-trust Kubernetes clusters, CI/CD pipeline to runtime workload identity, and identity-based cloud data protection, company sources said. They added that the solution removes the friction between development and security by fitting right into the existing CI/CD tools. This ensures that every workload going out of the pipeline is continuously verified against attacks and exploits, and that only such validated, healthy state workloads can communicate and access data.

Red Hat OpenShift features full-stack automated operations to manage hybrid cloud and multi-cloud deployments. It is optimised to improve developer productivity and promote innovation.

Password Manager Resources will allow developers to integrate website-specific requirements used by the iCloud Keychain password manager to generate strong, unique passwords, company sources said. It also contains a collection of websites known to share a sign-in system, as well as links to websites' pages where users change passwords.

The company has said that every time a password manager generates a password that isn't actually compatible with a website, users not only have a bad experience but get tempted to create their own passwords. The tech giant is also encouraging developers to incorporate data and other resources from the project into their own apps.

Anaconda and IBM Watson join hands to boost innovation in AI

Anaconda Inc. and IBM Watson have announced a collaboration to help simplify enterprise adoption of open source AI technologies. The partnership aims to help boost innovation and address the AI and data science skills gap that many enterprises face today.

Currently, many data scientists rely on open source technologies for innovation and to tap into AI skills and talent. Open source in the enterprise can be complex to adopt and manage, from both a technical and operational standpoint
