

Figure 3: Wordfence registration

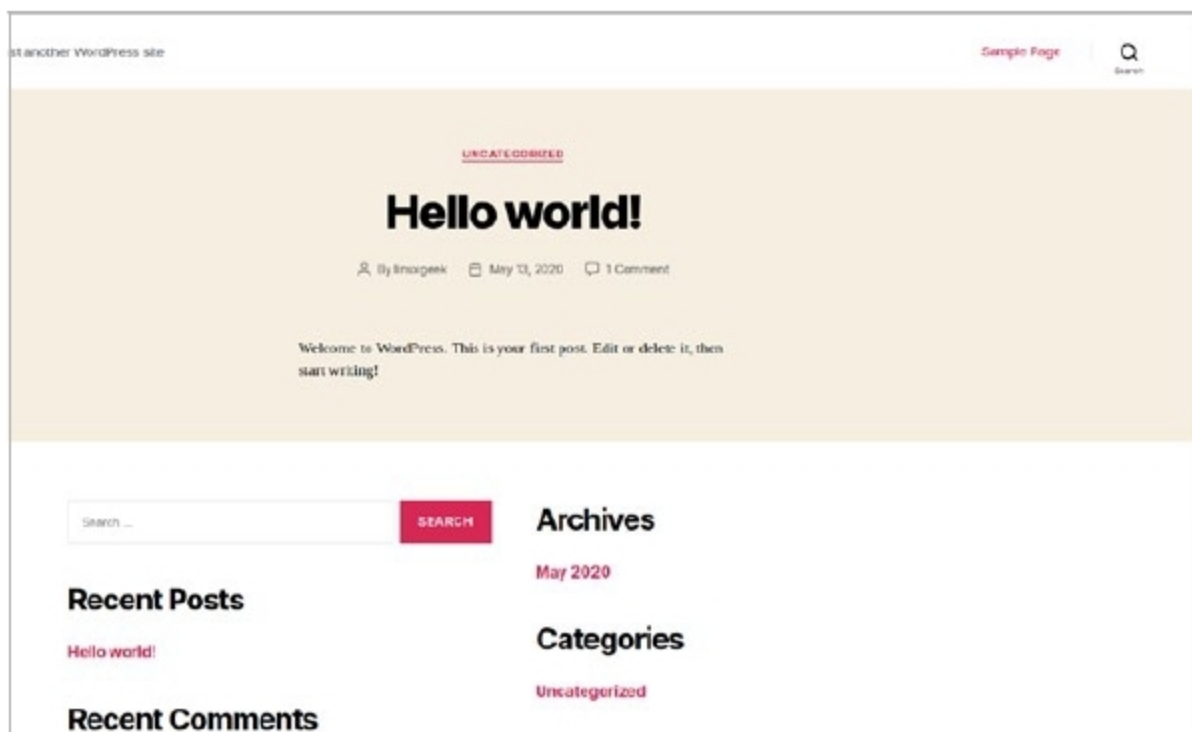

Figure 4: Final live site

backend, the following three services should run. To check if they are, execute the following commands:

```
sudo systemctl status nginx.service
sudo systemctl status mysql.service
sudo systemctl status php7.4-fpm.service
```

Output of these 3 commands should be active (running).

Section 11 - Completing the installation through the Web browser

The backend installation is done. So open your browser and insert the following URL:

<https://osfy-test.linuxgeek.in/>
or

<http://osfy-test.linuxgeek.in/>

Completing the WordPress installation through the browser

- Step 1: Select the language.
- Step 2: Configure your site name, user name, password, your mail and discourage SEO.
- Step 3: Log in with credentials.

Section 12 - Installation of a security related plugin

After login, you will see the WordPress dashboard. Now let's install a security related plugin. So click on 'Plugins' and then on the 'Add New' button. In the 'Search' box, type 'Wordfence Security-Firewall & Malware Scan'. Before installing this plugin, give write permission to the `wp-content` directory. So go back to the terminal and execute the following

commands:

```
cd /var/www/html/osfy-test.linuxgeek.in
chmod g+w wp-content/ -R
```

Go to the browser dashboard and install that plugin. After that, you will see the button for 'Activate'. Click on it.

After activation, open the screen shown in Figure 3. Enter your email ID, agree to the terms and click on the 'Continue' button.

The plugin installation is done. So now, repeat Section 6.

Go back to the site in the browser. You will see the 'Wordfence' option in the sidebar. Click on it and then click on 'Manage Firewall'.

Change the 'Web Application Firewall Status' 'Learning Mode' to 'Enabled and Protecting'. Save this so you can do various settings in this. Go back to the 'Wordfence' dashboard. Click on 'Manage Scan', select 'High Sensitivity' and save it.

Again, go back to the 'Wordfence' dashboard. In the sidebar, you will see the 'Scan' option, which you can click on and then on 'Start new scan'. This will scan all files, directory permissions and the contents.

Finally, it's done

The installation is done and ready for use. You can visit the site by typing in the following URL in the browser:

<https://osfy-test.linuxgeek.in/>

or

<http://osfy-test.linuxgeek.in/>
