

defined infrastructure, and application delivery. This will give enterprises greater control, flexibility, and cost efficiencies while undergoing digital transformation.

Harsh Marwah, chief growth officer at iValue InfoSolutions, said that the company is excited

to partner with SUSE. He added that iValue's partnership with SUSE will help partners and customers build sustainable, reliable, cost-effective, and secure IT stacks based on open source technologies. iValue and SUSE aim to help customers transform their enterprises by tapping into open source innovations that offer no vendor lock-in, and are highly flexible, scalable and cost-effective.

Rajarshi Bhattacharyya, country manager at SUSE India, said, "iValue's go-to-market strategy complements SUSE's for its open source offerings. SUSE is excited to partner with iValue to enable customers to realise their digital transformation goals. This will be done by simplifying, modernising, and accelerating their traditional and cloud-native applications across any IT landscape in any environment."

Facebook AI launches open source Chatbot named Blender

Facebook's AI has built an open source open-domain chatbot called Blender as per a blog post by the company. *Engadget* reported that Blender has been trained on 9.4 billion parameters, which is more than ten times as many as the previous largest OS chatbots available on the internet.

Facebook said that Blender is the first chatbot to come with a diverse set of conversational skills like empathy, knowledge and personality, all in one system. The blog stated that in terms of engagement, the bot feels 'more human' according to human evaluators. It has been designed in such a manner that it can assume a persona, discuss nearly any topic, and show empathy in natural, 14-turn conversation flows.

The tech giant also said the bot uses transformer neural networks on large amounts of conversational data. It uses previously available public domain conversations that have 1.5 billion training examples of extracted conversations.

Facebook said that it has introduced Blended Skill Talk (BST) for training and evaluating desirable skills linked to personality, knowledge, and the display of empathy.

Cloud Foundry community and foundation to provide tutorial hub for new users

The Cloud Foundry Foundation has launched a hub for Cloud Foundry-related tutorials. This will streamline the discovery and learning process for developers interested in learning more about the family of open source projects. The tutorials have been created and curated by the community, and will be provided in a free, simple way to learn about Cloud Foundry.

As developers discover more about the technology, they are able to provide comments directly to the community -- about what they have found valuable and what is missing. This generates a cycle of feedback that enables the foundation to create new materials to fill gaps in topics. This feedback loop mimics the technical contributions made to open source projects. It builds a collaborative ethos for Cloud Foundry and other open source communities.

Steve Greenberg, founder of Resilient Scale said, "Resilient Scale is happy to lend our services by partnering with Cloud Foundry and the community in order to build this new resource. The tutorial hub will make it easier for people unfamiliar with Cloud Foundry to give it a try and reach out to enterprise developers struggling with inefficient deployment environments."
