

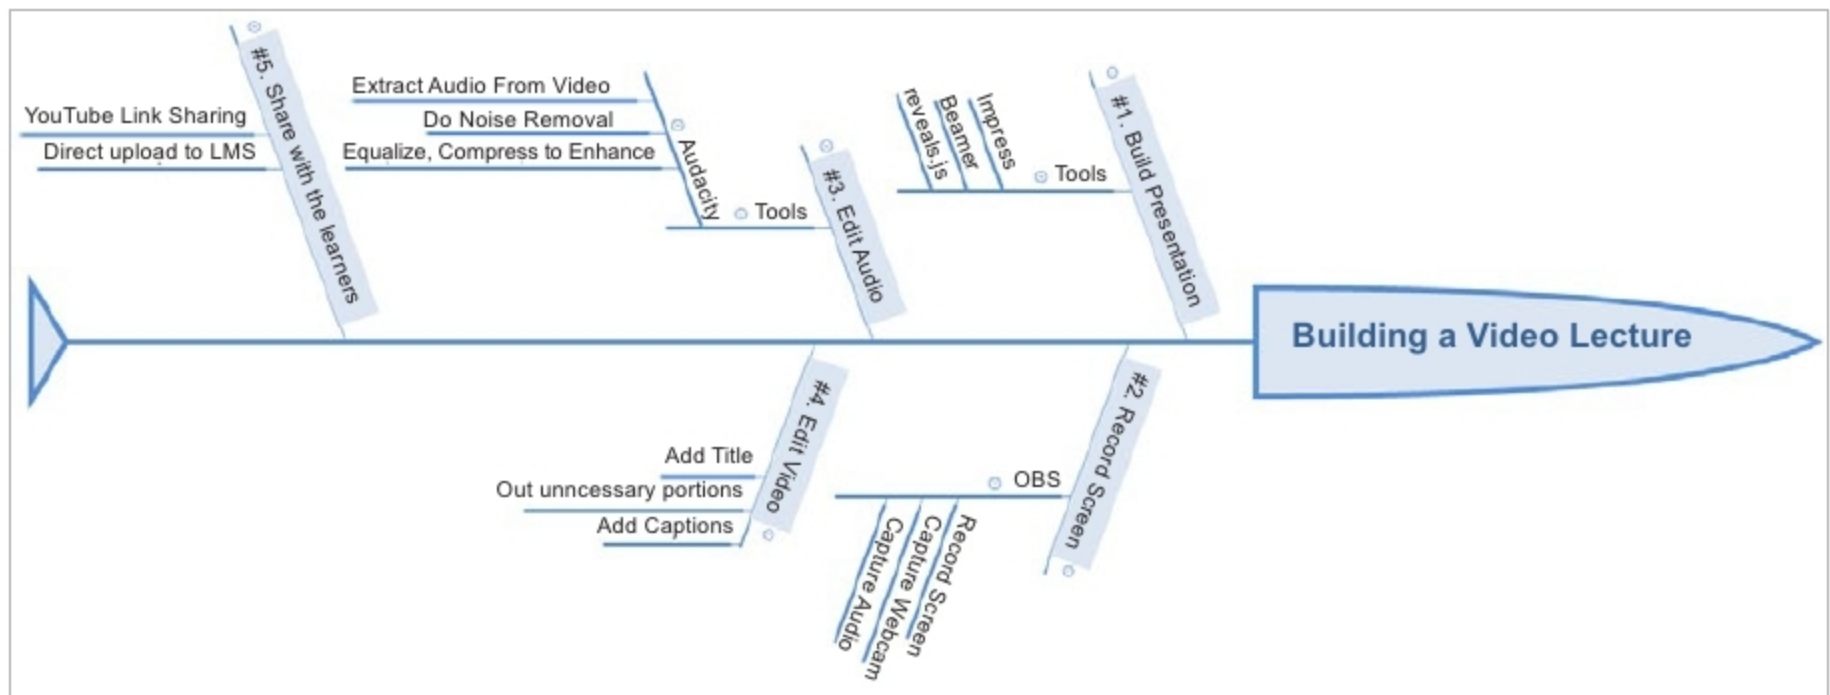

Figure 5: The steps to building a video lecture

Figure 6: Free and open source video editors

Step 3: For a video lecture to be effective, the audio quality is a key factor. As the teachers might be recording their lectures at their homes, there could be some sort of noise. The audio quality can be greatly enhanced with the open source audio processing software, Audacity. The audio from the video file can be extracted by opening it in Audacity. Then the audio can be enhanced. The software has options to remove noise by identifying the noise sample from the audio. Functions such as *Equalize* and *Compress* can be used to enhance the audio to sound like a studio recording. Audacity can be used to record audio alone, or as a separate

track, which can be used for a podcast, or an audio-only lecture.

Step 4: This involves editing the video, for which the FOSS tools available are really impressive. The three important options are:

- OpenShot (<https://www.openshot.org/>)
- Kdenlive (<https://kdenlive.org/en/>)
- ShotCut (<https://shotcut.org/>)

All these video editors are cross-platform. If you are a beginner, try exploring OpenShot, which is easy to use. Even if you don't have a higher configuration system, you should try OpenShot. Once you are comfortable with it, try exploring ShotCut and

Kdenlive, which offer additional features.

Step 5: Once your video is ready, you can either upload it to the Web (you can use a service such as YouTube) and share the link with the learners or if you don't want to adopt this method, you can directly upload it to your LMS itself.

Building interactive content:

The lecture videos are unidirectional, i.e., they lack interactivity. Interactive learning resources enable learners to interact with the content. Let's explore two services that enable interactivity:

- TED-ED
- H5P

TED-ED is a Web based service (<https://ed.ted.com>) to build interactive learning videos. To use TED-ED, just select an existing video, and add questions or prompts. This enables reaction responses from the users. This is a great tool that makes the content more interesting.

H5P (<https://h5p.org/>) stands for HTML5 package. It is a free and open source content-collaboration framework. In other words, you can use it to build interactive videos, quizzes, find hotspots, etc.

Evaluation tools

Evaluation is an integral part of
