the teaching-learning process. The interactive content explained in the earlier section can also be used as evaluation tools at the micro level. There are many open source evaluation tools to conduct holistic evaluation. Three of these are listed below:

- Hot Potatoes (<http://hotpot.uvic.ca/>)
- TCExam (<https://tcexam.org/>)
- VirtualX (<http://virtualx.sourceforge.net/>)

Hot Potatoes is available as freeware. It can be used to build the following types of tests: multiple-choice, short-answer, jumbled-sentences, crosswords, matching/

ordering and gap-filling.

The major features of TCExam are that it is open source, platform-independent, has community support, accessibility (as per Web Content Accessibility Guidelines that support persons with disabilities), and the capability to conduct paper testing with OMR (optical mark recognition) sheets, etc.

The various features of VirtualX to conduct tests include the capability to author and organise questions. It has support for 12 different types of questions, for formulas and equations, as well as for graphical analysis.

Free and open source video conferencing

Though there are many useful proprietary tools available to conduct video conferencing, open source software always score better in terms of privacy. One easy-to-use open source tool for video conferencing is Jitsi. It can be used in two different ways — to make a custom installation or by using the Jitsi Meet (<https://meet.jit.si/>) service, which is a live version. The latter is very simple and anyone can start a meeting by simply entering a meeting ID. There is no need for any installation if you are using a desktop/laptop. For smartphones, you have to install the Jitsi app. Some of the features of Jitsi are:

- Browser based
- No time limits
- Capability to share screens
- Option to stream in YouTube
- Cloud based recording using Dropbox
- Integrated chat option

Jitsi is certainly worth exploring. A video tutorial is available at <https://youtu.be/ymAtXVbotoU>.

Open resources

It is not always a viable option to build each learning resource from scratch. There are many open educational resources (OERs) available. Some of the important OER repositories are listed below.

- OER Commons (<https://www.oercommons.org/>): This is a public digital library of open educational resources. It has features to explore, create and collaborate. The Open Author tools make the creation of resources simple by providing a Web interface. If you have some educational content to share, you should explore Open Author.
- MERLOT (<https://www.merlot.org/merlot/>): This stands for Multimedia Education Resource for Learning and Online Teaching. It provides access to a collection
